

FRANCO HEREFORDS

in conjunction with

PARSON HILL HEREFORD STUD

ANNUAL BULL & FEMALE SALE

12 July 2019 – 1.30pm

on property at

“Avoca Vale”
4015 Tenterfield Road
Woodview via Casino
Cattle penned 10.00 am
Brett Hannigan – 0429 675 115
Frank Hannigan – 02 6662 4122

www.francoherefords.com.au

Thank you for taking the time to attend our sale.

Normally, when we have tough seasons, opportunities exist to purchase excellent genetics economically. We expect this year to be such a year.

Studmasters often say that the current year's sale bulls are the best they have presented. We try not to do that, but this year we believe the top end of our sale bulls are some of the best we have produced.

The lead bulls this year are by Battalion Black Hawk K7, who we purchased at the 2016 Glen Innes sale for \$45,000 + GST and immediately after the sale sold a half share to Thornleigh Herefords. The sons presented at this sale are exceptional and have sire potential. We suggest you look at the breedplan, index values and length of these bulls.

Once again, this year Damona C372 Nashdale F003, has some magnificent sons in the early part of the sale. Lots 26, 27 & 28 are bulls that stand out and have great potential. Interestingly the 3 dams of these bulls all have very good calves on them this year as well.

We are very proud of the progeny of our own bred Parson Hill Jarrah J807 sold to Mr Erris Vidler. We are keeping one of his sons for stud use this year but recommend to you Lots 22, 33 & 34.

We also recommend the Haymaker bulls. You will recall we bought Sugarloaf Haymaker H126 for \$41,000 + GST at Wodonga. We are really excited about the calves the Haymaker females are producing.

To all prospective buyers we advise, whilst we wait for more rain, we are happy to keep your bull on our property at Avoca Vale on the basis of all care but no responsibility.

Our bulls are treated as follows: Bovine Ephemeral Fever vaccine (3 Day Sickness), 7 in 1, Dectomax or Cydectin, Vibrovax and Pestigard.

We thank those who show interest in our cattle and a special thank you to the purchasers and under-bidders. We also thank people who have purchased our cattle in past years.

Thank you to all who assist: Grant for presenting the cattle for us; Dean, our man on the Horton; as well as our Woodview team – Brett, Mick, Glen, Jason, Ruth and Renee. We also take this opportunity to thank our loyal helpers Mary, Helen, Sharee, Edwin, Rino, John, Selma, Mick, Pauline and sons. We very much appreciate your support.

Franco Herefords Team

Hereford Selection Indexes

EBV: The Estimated Breeding Value is the estimated genetic merit of an animal for each recorded production trait. EBVs reflect the difference that can be expected in an animal's performance relative to the breed baseline of zero for each trait. On average, half of this difference will be passed on to the animal's progeny. EBVs in this report are calculated from the available performance information on the animal, its parents, progeny and its close relatives across a number of herds. This information is adjusted for age at measure and dam age while allowing for differences between herds, years, season of calving, management effects and for mating and selection biases.

If no EBV is listed in an animal's record, then not enough information for the animal is available to report an EBV for that trait.

ACC: Accuracy (%) is based on the amount of performance information available on the animal and its close relatives - particularly the number of progeny analysed. Accuracy is also based on the heritability of the trait and the genetic correlations with other recorded traits. Hence accuracy indicates the "confidence level" of the EBV. Accuracy values range from 0-99% and indicate the probability of an EBV changing with the addition of more progeny data. The magnitude of possible change decreases as accuracy increases. Accuracy below 50% should be regarded as low, between 51-90% as medium and above 90% as high. The accuracy is printed below the EBV for the trait.

Calving Ease EBVs are based on calving difficulty scores, birth weights and gestation length information. The EBVs are reported as differences in the percentage of unassisted calvings. More positive EBVs indicate easier calving.

DIR: Direct CE indicates how this animal influences the birth of its progeny from two-year-old heifers.

DTRS: Daughter's CE indicates how easily the animal's daughters will calve.

GL: Gestation Length EBV (days) is based on AI and hand mating records. Lower (negative) GL EBVs indicate easier calving and increased growth after birth.

BWT: Birth Weight EBV (kg) is based on the measured birth weight of animals, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200: 200-Day Growth EBV (kg) is calculated from the weight of animals taken between 80 and 300 days of age. Values are adjusted to 200 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400: 400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600: 600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

MCW: Mature Cow Weight EBV (kg) is an estimate of an estimate of the genetic difference in cow weight at 5 years of age. Smaller, or more moderate EBVs are generally more favourable.

MILK: 200-Day Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of their daughter's milking ability on the 200-day weight of their calves.

SS: Scrotal Size EBV (cm) based on the scrotal circumference measurements of bulls taken between 300 and 700 days of age, and adjusted to 400 days of age. This EBV is an indicator of male fertility in regards to semen quality and quantity. Higher (positive) EBVs indicate higher fertility. There is also a small negative correlation with age of puberty in female progeny.

DC: Days to Calving EBV (days) is an indicator of female fertility based on the time between a cow's first exposure to a bull and when she subsequently calved. Cows that calve late in the season or fail to calve are penalised. Lower (negative) EBVs are preferred indicating shorter days to calving for the sire's daughters.

CWT: Carcass Weight EBV (kg) estimates the genetic difference in untrimmed hot carcass weight and is adjusted to 650 days of age. More positive EBVs indicate heavier carcass weights at 650 days of age.

EMA: Eye Muscle Area EBV (cm²) estimates genetic differences in eye muscle area at the 12/13th rib site of a 300kg dressed carcass. More positive EBVs indicate better muscling on animals.

RIB: Rib Fat EBV (mm) estimates the genetic differences in fat depth at the 12/13th rib in a 300kg dressed carcass. More positive EBVs indicate more subcutaneous fat and earlier maturity.

RUMP: Rump Fat EBV (mm) estimates the genetic differences in fat depth at the P8 site of a 300kg dressed carcass. More positive EBVs indicate more subcutaneous fat and earlier maturity.

RBV%: Retail Beef Yield Percent EBV (%) represents total (boned out) meat yield as a percentage of a 300kg dressed carcass. A more positive EBV indicates higher percentage yield for the 300kg carcass size.

IMF%: Intra-muscular Fat Percent EBV (%) is an estimate of the genetic difference in the percentage of intra-muscular fat at the 12/13th rib site in a 300kg carcass. Depending on market targets, larger more positive values are generally more favourable.

SM: The Supermarket Index estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd targeting the domestic supermarket trade. Steers are either finished on grass or grain (eg 50-70 days). Steers are assumed marketed at 450 kg live weight (250kg HSCW and 12 mm P8 fat depth) at 17 months of age. Daughters are retained for breeding. In response to industry feedback regarding eating quality and tenderness, a small premium has been placed on marbling.

GS: The Grass Fed Steer Index estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd targeting pasture finished steers. Steers are assumed marketed at 600 kg live weight (330 kg HSCW and 8 mm P8 fat depth) at 23 months of age. Daughters are retained for breeding. In response to industry feedback regarding eating quality and tenderness, a small premium has been placed on marbling.

GN: The Grain Fed Steer Index estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd targeting pasture grown steers with a 125-day feedlot finishing period for the grain fed markets. Steers are assumed marketed at 600 kg live weight (330 kg HSCW and 20 mm P8 fat) at 20 months of age. Daughters are retained for breeding. There is a significant premium if steers reach a marble score of 2 or greater.

EU: The EU Index estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd targeting pasture finished steers for the EU market. Steers are assumed marketed at 620 kg live weight (340 kg HSCW and 14 mm P8 fat depth) at 24 months of age. Daughters are retained for breeding. There is no marbling requirement.

The Hereford GROUP BREEDPLAN Estimated Breeding Values contained in this Sale Catalogue were compiled by the Agricultural Business Research Institute (ABRI) from data supplied by the breeders. Neither Herefords Australia Limited nor the ABRI oversee or audit the collection of the data.
