To Whom It May Concern,

This letter is to verify that I, Dr. Brittany Newton, examined 'Remonah', a 4 year old, grey, Australian Stockhorse mare on the 29.05.19.

It is reported that this mare was found to have light blue areas located in her right eye, first detected at weaning.

On examination, this mare was found to be in good general health. Gross observation revealed light blue areas located inside the medial and lateral aspects of the pupil. No blepharospasm detected or discharge present. On further ophthalmologic examination, the menace response was found to be intact and the areas in question were reflective to light. The pupil also constricted and dilated appropriately in the presence and absence of light.

It was determined that at the time of examination, this abnormality had no effect on vision and the mare was considered sound.

If there are any further questions in regards to this mare, please do not hesitate to contact me at Longreach Veterinary Service on 07) 4658 3838.

Regards,

Dr. Brittany Newton
