To Whom It May Concern,

This letter is to verify that I, Dr. Brittany Newton, examined 'Traveller', a 3 year old, bay roan, Australian Quarterhorse mare on the 29.05.19.

It is reported that this mare has been found to have episodes of the hind limbs appearing to lock, after stable rest or physical exertion.

On examination, this mare was found to be in good general health. The mare was observed at both the walk and trot. No lameness was detected. However, after stopping the mare, then walking off again, the offside stifle joint became locked in extension for a short period, and then corrected itself.

A suspected diagnosis of upward fixing patellars has been made. However, further diagnostics and examination would be required to determine severity and possible treatments.

If there are any further questions in regards to this mare, please do not hesitate to contact me at Longreach Veterinary Service on 07) 4658 3838.

Regards,

Dr. Brittany Newton
