# Waratah White Suffolks

**90 Rams ~ 30 Stud Ewes**

**On property  
Clarke St, Branxholme**

**1.00pm Monday October 14th**

Inspection from 11.00 am

Light lunch provided

Waratah White Suffolks  
Steve & Debbie Milne  
03 55786327  
Steve 0428 786327  
Debbie 0407 724066

**Bernie Grant, LMB Livestock 0417 712144**  
3% rebate to outside Agents

**To be eligible for AWSA transfer as a stud  
sire minimum ram price is \$2000 (plus GST)**

# LAMBPLAN

The information in this catalogue is to help you make an informed decision on the objective merits of the sheep on sale. The ASBVs can be used to select the sheep that will most suit your growing conditions and the market that you are aiming to service.

An ASBV is an estimate of the genetic potential a sheep will pass on to its progeny. ASBVs are available for a range of economically important traits and are designed to be used in conjunction with visual selection.

The appearance and performance of an animal is a combination of its genes and the environment in which it is raised (e.g. the amount and quality of feed, single or twin birth type). ASBVs account for these environmental effects, allowing the comparison of sheep based on the genes they will pass on to their progeny. It is important to remember when selecting sheep you are choosing the genes, not the environment.

## **ASBV's**

ASBVs are expressed as either positive or negative deviations from the average of the 1990 drop. For example, a ram with a post weaning weight (Pwwt) of +10.2, will have progeny that will on average be 5.1kg heavier at post weaning than an animal with a Pwwt ASBV of 0. (Rams contribute half the genetics of their progeny the ewe the other half)

## **ASBV ACCURACY (%)**

This is a reflection of the amount of information available on each animal for each trait. As the amount of information increases the accuracy increases. The higher the accuracy, the closer the ASBV is to the true breeding value of the animal.

## **Bwt: Birth Weight (kg)**

Rams with more negative BWT ASBVs produce lambs which are lighter at birth. *(BWT ASBVs estimate the genetic difference between animals in live weight at birth)*

**Wwt and Pwwt: Weaning and Post weaning Weight (kg)** - Rams with more positive WT ASBVs produce progeny that grow quicker and are heavier at a certain age. Wwt refers to lambs at 3 to 6 months of age. Pwwt refer to lambs at 7 to 10 months of age. *(WT ASBVs estimate the genetic difference between animals in live weight at a given age)*

## **Pfat: Fat Depth (mm)**

Rams with more negative FAT ASBVs produce progeny that are leaner. *(FAT ASBVs estimates the genetic difference between animals in GR fat depth)*

**Pemd: Eye Muscle Depth (mm)** - Rams with more positive ASBVs for EMD will produce progeny that have more muscle, independent of weight, and a

higher lean meat yield. *(EMD ASBVs estimate the genetic difference between animals in eye muscle depth at the C site)*

**WEC: Worm Egg Count (%)** - Rams with more negative WEC ASBVs produce progeny who have a higher genetic potential to resist worm burdens. Lower WEC ASBVs are desirable. *(WEC ASBVs estimate an animal's genetic ability for carrying worm burdens. This is a combination of being genetically less likely to pick up worms, and being able to cope immunologically with the worm burden. WEC ASBVs are expressed as a percentage relative to a count of 500 eggs per gram)*

### **Sheep Selection**

Selecting animals involves balancing several key traits. To make selection easier traits can be combined into a selection index. A selection index combines ASBVs for several traits to give a single value. This reflects the performance of the sheep relative to the breeding objective of the particular index.

For more information go to [www.sheepgenetics.org.au](http://www.sheepgenetics.org.au)

### **“Eating Quality” ASBV’s**

Eating quality traits are now able to be measured using a DNA genomic test. Steve and Debbie have included these traits into their breeding program. They have tested 200 rams over the last 2 years to improve the pedigree information that Sheep Genetics uses in the calculation of these eating quality ASBVs. This information is now included in the catalogue.

- Dressing% (Dress%) Dressing Percentage is an estimate of the carcass weight as a proportion of live weight at slaughter
- Lean Meat Yield (LMY) gives an indication of the proportion of meat compared to fat and bone in the carcass.
- Intra Muscular Fat (IMF) gives an indication of the amount of fat within the meat, important for taste and flavour.
- Shear Force (SF5) is an indication of tenderness—the amount of force required to cut through a piece of meat. The more negative the breeding value for this trait the better—less force = more tender!

There is an undesirable correlation between lean meat yield (more muscle) and eating quality (taste and tenderness). A new index called LEQ is available that aims to improve eating quality traits whilst improving carcass production.

From 2020 Carcase + will no longer be available and is being replaced by a new index called TCP (Total Carcase Production). (More information on pages 10 and 11)

***Vision, Performance, Integrity***

Waratah White Suffolk Stud was founded in October 1995. Foundation ewes were purchased from Detpa Grove, the White Suffolk National Sale and Gadang.

Since foundation the Waratah flock has been performance tested through Lambplan. Rapid genetic improvement has been made in the economically important traits of growth and muscling. At the same time, selection pressure is placed on easy lambing, fertility, parasite resistance and structural soundness. We now include eating quality traits in our breeding objective.

Our goals are to produce rams that will sire lambs to meet the requirements of the domestic market specifications. To that end, we aim to produce rams with low birth weight, high growth rate, moderate fat (too lean and the lambs will be hard to finish) and excellent muscle. We are also now focusing on eating quality traits to produce tender tasty lamb.

The flock is Brucellosis accredited (Accreditation No. 3463), OJD MAP MN3 - V (VS1167). All sheep back-lined annually. All sale sheep drenched with Startect and vaccinated with 6 in 1.

# Terminal Carcase Production (TCP) index

---

## Replacement for Carcase Plus

### Key points

- ✓ Carcase Plus has been an important index for the sheepmeat industry but it has been found to have a negative impact on eating quality. Because of this and the industry's focus on delivering high eating quality outcomes for consumers, the index will be retired in March 2020.
- ✓ Carcase Plus will be replaced with the Terminal Carcase Production index. To assist in the transition between indexes both Carcase Plus and Terminal Carcase Production will be available for the 2019 ram buying season.
- ✓ The Terminal Carcase Production (TCP) index will give similar improvements in growth and lean meat yield as Carcase Plus while also maintaining eating quality.

### What is the new TCP index?

Indexes help producers select animals for use within a breeding program when there are a range of traits of economic or functional importance. This ensures that genetic gain in one trait is not made in isolation from other traits. Using indexes in ram purchasing decisions allow producers to make balanced genetic progress towards more profitable sheep.

The TCP index has been created to assist producers to achieve both gains in their major production traits, such as post-weaning weight and muscling, as well as ensuring consumer satisfaction from lamb is maintained through focusing on key eating quality traits such as shear force (tenderness) and intramuscular fat (marbling).

The TCP index is designed to suit a production system where:

- ✓ all progeny are terminal
- ✓ improving growth and muscle is of commercial benefit
- ✓ increasing lean meat yield has a positive financial impact
- ✓ a small degree of emphasis is included to maintain or improve eating quality.

### Using the TCP index

The TCP index, unlike Carcase Plus, is on a scale that is aligned with other Sheep Genetics' indexes and is represented in economic terms with a unit increase in the index reflecting an additional dollar per ewe joined per year. To assist in comparing rams, Sheep Genetics recommends using a percentile band table as reference. The figure below, which is based on the percentile band table, highlights the TCP index value for significant percentiles for the 2018 drop animals.

## Percentile band range graphic for TCP index 2018 drop animals

## Comparison of TCP and Carcase Plus index values for significant percentiles for 2018 drop animals

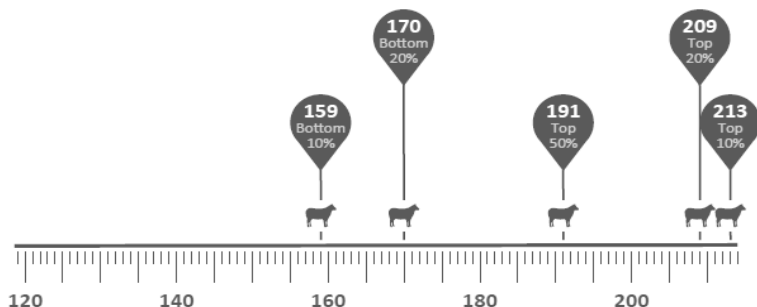

### Terminal Carcase Production
