# **Waratah White Suffolks**

**90 Rams ~ 18 Stud Ewes**

**On property  
Clarke St, Branxholme Vic**

**1.00pm Monday October 12th  
Inspection from 11.00 am**

Covid-19 safe plan in operation on sale day including registration on arrival, compulsory masks, social distancing and hand sanitizer stations. Please do not attend if you are unwell. Sale is interfaced with Auctions Plus with live audio. All sheep will be delivered (no delivery on sale day).

Due to Covid 19 restrictions lunch will not be available.

**Covid-19 safe Pre-sale inspections days will be held by appointment only on Monday 5th October and Friday 9th October. Ring Steve or Bernie Grant LMB Livestock to book your appointment.**

Waratah White Suffolks Steve & Debbie Milne

Steve 0428 786327

Debbie 0407 724066

**Bernie Grant, LMB Livestock 0417 712144**

**3% rebate to outside Agents**

**To be eligible for AWSA transfer as a stud sire minimum ram price is \$2000 (plus GST)**

# LAMBPLAN

The information in this catalogue is to help you make an informed decision on the objective merits of the sheep on sale. The ASBVs can be used to select the sheep that will most suit your growing conditions and the market that you are aiming to service.

An ASBV is an estimate of the genetic potential a sheep will pass on to its progeny. ASBVs are available for a range of economically important traits and are designed to be used in conjunction with visual selection.

The appearance and performance of an animal is a combination of its genes and the environment in which it is raised (e.g. the amount and quality of feed, single or twin birth type). ASBVs account for these environmental effects, allowing the comparison of sheep based on the genes they will pass on to their progeny. It is important to remember when selecting sheep you are choosing the genes, not the environment.

## ASBV's

ASBVs are expressed as either positive or negative deviations from the average of the 1990 drop. For example, a ram with a post weaning weight (Pwwt) of +10.2, will have progeny that will on average be 5.1kg heavier at post weaning than an animal with a Pwwt ASBV of 0. (Rams contribute half the genetics of their progeny the ewe the other half)

## ASBV ACCURACY (%)

This is a reflection of the amount of information available on each animal for each trait. As the amount of information increases the accuracy increases. The higher the accuracy, the closer the ASBV is to the true breeding value of the animal.

## Bwt: Birth Weight (kg)

Rams with more negative BWT ASBVs produce lambs which are lighter at birth. (*BWT ASBVs estimate the genetic difference between animals in live weight at birth*)

**Wwt and Pwwt: Weaning and Post weaning Weight (kg)** - Rams with more positive WT ASBVs produce progeny that grow quicker and are heavier at a certain age. Wwt refers to lambs at 3 to 6 months of age. Pwwt refer to lambs at 7 to 10 months of age. (*WT ASBVs estimate the genetic difference between animals in live weight at a given age*)

## Pfat: Fat Depth (mm)

Rams with more negative FAT ASBVs produce progeny that are leaner. (*FAT ASBVs estimates the genetic difference between animals in GR fat depth*)

**Pemd: Eye Muscle Depth (mm)** - Rams with more positive ASBVs for EMD will produce progeny that have more muscle, independent of weight, and a

higher lean meat yield. (*EMD ASBVs estimate the genetic difference between animals in eye muscle depth at the C site*)

**WEC: Worm Egg Count (%)** - Rams with more negative WEC ASBVs produce progeny who have a higher genetic potential to resist worm burdens. Lower WEC ASBVs are desirable. (*WEC ASBVs estimate an animal's genetic ability for carrying worm burdens. This is a combination of being genetically less likely to pick up worms, and being able to cope immunologically with the worm burden. WEC ASBVs are expressed as a percentage relative to a count of 500 eggs per gram*)

### **Sheep Selection**

Selecting animals involves balancing several key traits. To make selection easier traits can be combined into a selection index. A selection index combines ASBVs for several traits to give a single value. This reflects the performance of the sheep relative to the breeding objective of the particular index.

For more information go to [www.sheepgenetics.org.au](http://www.sheepgenetics.org.au)

### **“Eating Quality” ASBV’s**

Eating quality traits are now able to be measured using a DNA genomic test. Steve and Debbie have included these traits into their breeding program. They have tested over 325 sheep to improve the pedigree information that Sheep Genetics uses in the calculation of these eating quality ASBVs. This information is now included in the catalogue.

- Dressing% (Dress%) Dressing Percentage is an estimate of the carcase weight as a proportion of live weight at slaughter
- Lean Meat Yield (LMY) gives an indication of the proportion of meat compared to fat and bone in the carcase.
- Intra Muscular Fat (IMF) gives an indication of the amount of fat within the meat, important for taste and flavour.
- Shear Force (SF5) is an indication of tenderness—the amount of force required to cut through a piece of meat. The more negative the breeding value for this trait the better—less force = more tender!

There is an undesirable correlation between lean meat yield (more muscle) and eating quality (taste and tenderness). A new index called LEQ is available that aims to improve eating quality traits whilst improving carcase production.

**Waratah**  
**Flock No 318**  
**Steve & Debbie Milne, Richmond Hill, Branxholme, 55786327**

***Vision, Performance, Integrity***

Waratah White Suffolk Stud was founded in October 1995. Foundation ewes were purchased from Detpa Grove, the White Suffolk National Sale and Gadang.

Since foundation the Waratah flock has been performance tested through Lambplan. Rapid genetic improvement has been made in the economically important traits of growth and muscling. At the same time, selection pressure is placed on easy lambing, fertility, parasite resistance and structural soundness. We now include eating quality traits in our breeding objective.

Our goals are to produce rams that will sire lambs to meet the requirements of the domestic market specifications. To that end, we aim to produce rams with low birth weight, high growth rate, moderate fat (too lean and the lambs will be hard to finish) and excellent muscle. We are also now focusing on eating quality traits to produce tender tasty lamb.

The flock is Brucellosis accredited (Accreditation No. 3463), OJD MAP MN3 - V (VS1167). All sale sheep drenched with Startect and are vaccinated with 6 in 1.

# LAMBPLAN terminal indexes

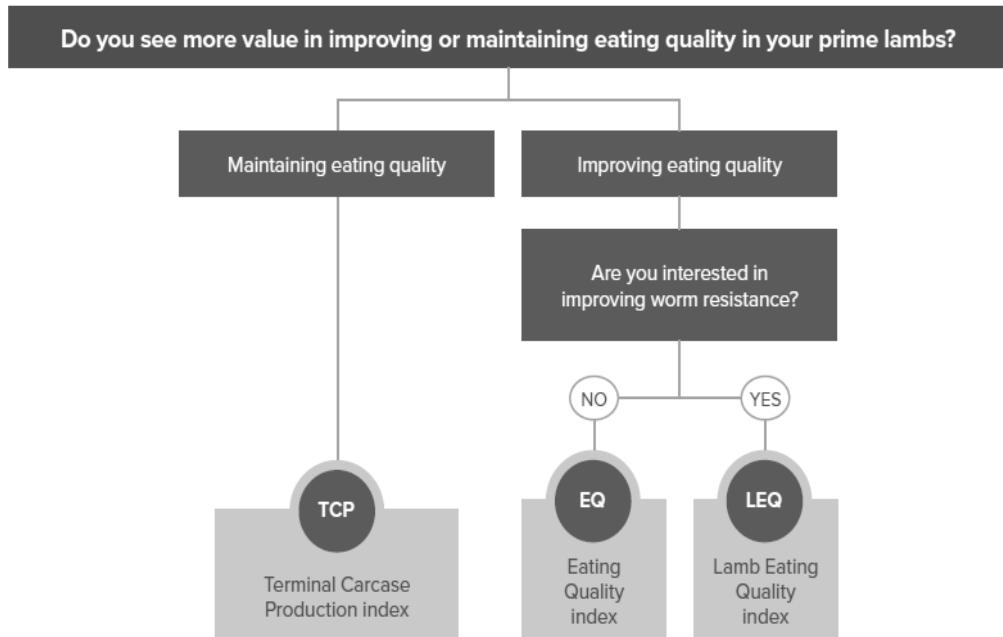

## A ram buyer's guide

Indexes help producers select animals for use within a breeding program when there are a range of traits of economic or functional importance, so that genetic gain in one trait is not made in isolation from other traits.

Using indexes in your ram purchasing decisions allows you to make balanced genetic progress towards more profitable sheep. A ram with a higher index will produce progeny that are more profitable in that production system.

### Choosing the right index

The following flowchart helps producers determine the best index for their terminal production system:

## Terminal Carcase Production (TCP)

The TCP index is for a prime lamb production system where terminal sires are joined to ewes of a Merino/ maternal breed or cross. The TCP index focuses on increasing weight and muscle while reducing carcase fat. These are changes which contribute to higher lean meat yield. TCP also has emphasis on modest improvements in eating quality.

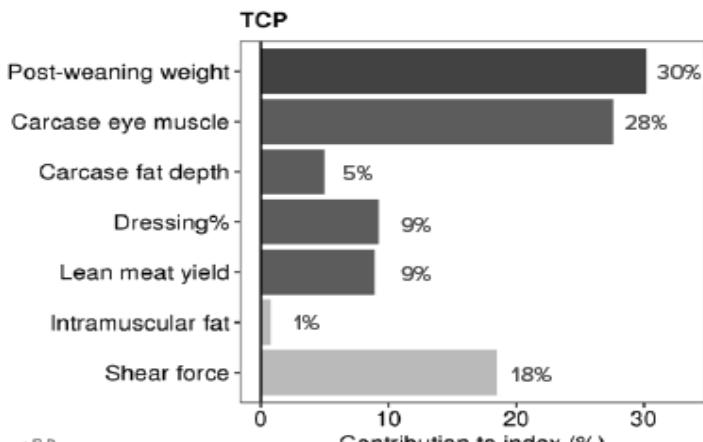

Typical trait changes for the TCP index include:

- increasing post weaning weight
- increasing carcase eye muscle depth
- decreasing carcase fat depth
- increasing dressing percentage
- increasing lean meat yield
- slightly improving eating quality.

Sheep with better eating quality will have higher ASBVs for intramuscular fat (more marbling) and lower ASBVs for shear force (better tenderness).

Figure 1 illustrates which traits are in the index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

**Figure 1: The traits In the TCP Index and how they contribute to the overall balance of the Index**

## Lamb Eating Quality (LEQ)

The LEQ index is for a prime lamb operation where terminal sires are joined to ewes of a Merino/maternal breed or cross in high rainfall and/or high input management systems where internal parasites may cause significant economic losses.

Producers who select this index are interested in improving the eating quality of their lambs to a greater degree than is possible with the TCP index. Growth and carcass traits will still improve, and inclusion of worm egg count will aid in control of internal parasites.

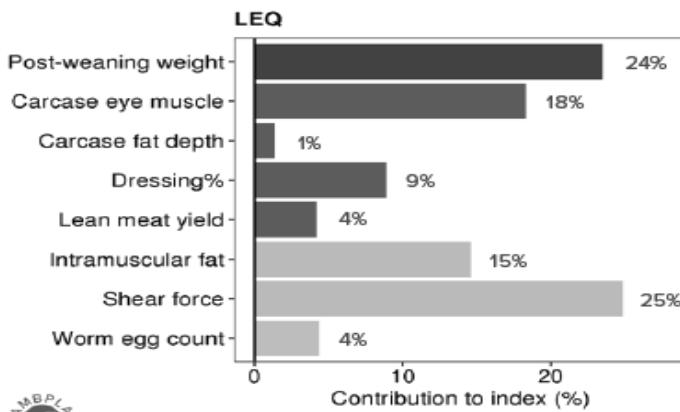

Typical trait changes for the LEQ index include:

- increasing post weaning weight
- increasing eye muscle depth
- maintaining/small reduction in carcass fat
- increasing dressing percentage
- increasing lean meat yield
- large improvement in eating quality
- increasing resistance to worms.

Sheep with better eating quality will have higher ASBVs for intramuscular fat (more marbling) and lower ASBVs for shear force (better tenderness).

Figure 3 illustrates which traits are in the index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

**Figure 3: The traits In the LEQ Index and how they contribute to the overall balance of the Index**
