

KENMERE CHAROLAIS

7th ANNUAL ON PROPERTY BULL SALE

“Moorak” Rankins Lane, Holbrook NSW

Friday 13th March 2020

Sale commences 1pm

50 Bulls

featuring

**HOMOZYGOUS
POLL BULLS**

Welcome 2020

Kenmere Charolais welcomes everyone to attend our 7th annual bull sale at "Moorak" Rankins Lane Holbrook, NSW. We are delighted to offer this draft of bulls in our catalogue. During 2019 we welcomed Glenn and Susie Trout to our stud team and Peter Bush to our property "Ellambah" at Cookardinia with the commercial cattle and stud heifers.

Glenn added a wealth of knowledge to our breeding programmes, health status and production. Our cattle numbers in the stud continue to grow with 238 calves born last year many from renown AI sires and our own bulls targeting the traits we believe to be necessary for both stud and commercial breeders. The online video of our cattle on our website clearly shows the females, calves and sires on our Moorak property. (www.kenmerecharolais.com.au)

We strive every year to improve our genetics' and continue to breed strong traits grown on grass. During 2019 this was more difficult than other years with the obvious drought conditions. Our catalogue provides the information required to assist in selecting the most suitable bull for your breeding programme.

Our stud has a strong record of performance recording and we are a member of Breed Plan. We hold a Five Star rating awarded as a result of methodical observations, recording data and timely submission to ABRI to ensure you receive the information that has been collected. The herd averages include data that has been collected over a period of fourteen years. We acknowledge that EBV figures can be a useful guide and understand there are many factors you need to consider when choosing your sale bull.

Kenmere is a J Bas 7 status with a Pesti Virus free herd and we have a consistently strong record of animal health status within our herds and we also record scan data on both our bulls and heifers.

Glenn and Susie successfully presented teams at both the Charolais National and Melbourne Royal. Our greatest success was the individual animals combining to win both Breeders groups. In Melbourne the group was awarded the interbreed breeders group trophy.

This team was a triumph for me personally as all three animals went back to the original Kenmere lines. The most notable heifer was a Kenmere Kristina MCS N44E who is a direct descendant to the original female line John Collins brought into Australia.

In conclusion we wish all cattle breeders the very best for 2020. It has been an extremely challenging time over the past years for all concerned. We pray for sufficient rain throughout Australia to help begin the rebuilding of the cattle industry in Australia.

Anne Seeley presenting Ann-Marie Collins with the Harold Selley Memorial Trophy for Most Successful Exhibitor: Melbourne Royal Show 2019

All bulls will be available for inspection prior to the sale by appointment at Holbrook by contacting Ann-Marie Collins 0412 608 043 or Glenn Trout 0409 322 420.

Kenmere Sale Bulls

Kenmere Sale Bulls

Kenmere Charolais specialises in the production of small numbers of quality bulls that are typically early finishing bulls suitable for both the Stud and Commercial cattleman. The scale of production enables us to concentrate on the traits we believe are important for producers to maximise profits from their progeny.

The real drivers for a profitable calf drop are live calves born early every year. At Kenmere we concentrate on calf shape, lower birth weight and short gestation as well as finishing ability and temperament.

There has been a strong focus on the finishing ability of the herd over many years. This includes using EBV's and scanning progeny for Rib and Rump fat and Marbling as well as proving our genetics in our own vealer production enterprise at Cookardina. Charolais are high performance cattle so you will still get a weight boost in the progeny even if the bull hasn't got high growth EBV's within the breed.

The bulls on offer have been bred from Kenmere Stud Sires and several International AI Sires. All the sires have been individually selected to join with Kenmere dams that comprise the backbone of our stud. At Kenmere our breeding programs are carried out on farm in order to retain control over the total operation including the hand selection of recipients and to help maintain the integrity of our JBAS 7 status.

The bull scanning provides an indication on the animal itself and should be closely considered during your evaluation. The most important assessment should be your visual inspection to look at the physical traits that you are seeking.

Disclaimer : People entering onto this property for any purpose whatsoever including attendance at cattle auctions do so at their own risk. We are not liable to you for any personal injury or death suffered by you and for theft loss or damage to any property caused or contributed to by us or by any other person whether caused or contributed to by or by negligence deliberate act or unlawful conduct. "We" or "us" or "our" refer to the owners their employees contractors and agents and each of them. While every care has been taken in compiling this catalogue to ensure accuracy of information supplied no responsibility is accepted for any errors which may have occurred.

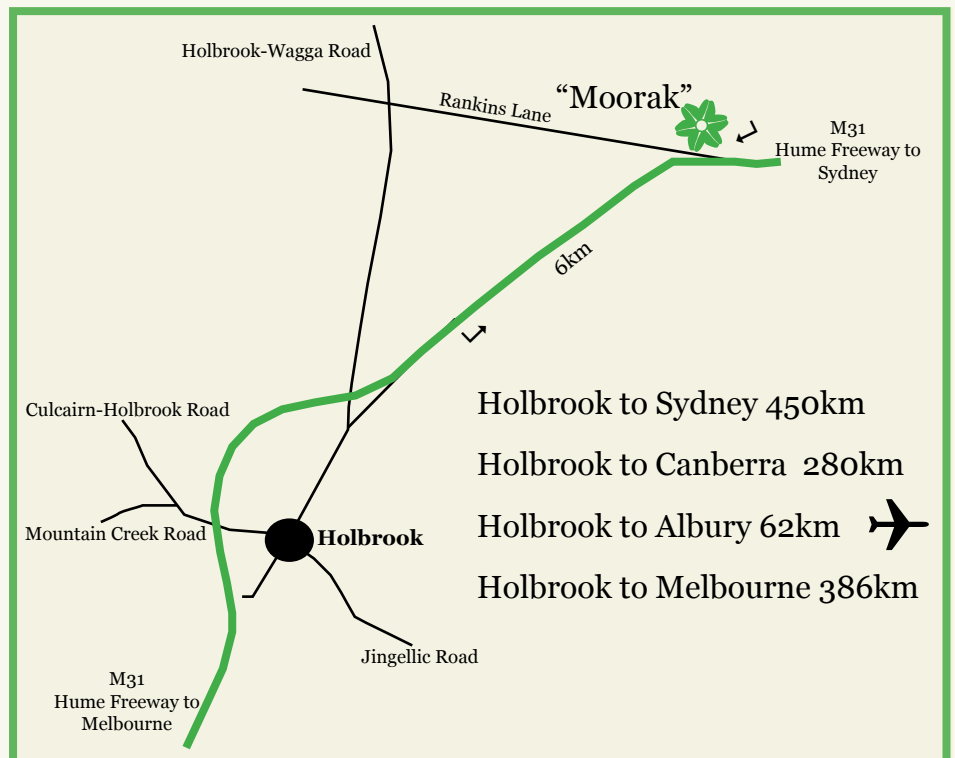

Kenmere Sale Bulls Preparation

At weaning at Kenmere the bulls are given a grain supplement to help them through the transition until adequate pasture is available. The bulls are then pasture raised until approximately 90 days prior to sale. They are then supplemented with a pellet ration to ensure they are ready to go out and work.

A 600 day weight and the first set of scan data (fat -rib & rump measurements, eye muscle area & marbling) was collected in November by Bovine Scanning Services, prior to the bulls going on any supplementary feed. This data was submitted to Breedplan to create more accurate carcass figures on the bulls. Breedplan will only accept one set of scan data therefore there's no supplementary feeding influencing these figures.

A pre-sale scan, weight and scrotal measurement will be taken in February to assist buyers in comparing the bulls. The bulls have a lifetime vaccination history and have received a booster shot of 7in1 in January 20 as well as a pour on drench.

All sale bulls have had a DNA sample analysed and the bulls have all been Sire Verified and horn/poll tested. There are 14 Homozygous Polled bulls in the sale draft. Holbrook Vet Clinic will conduct a structural assessment of each bull prior to sale and a semen test will be done to ensure the bulls are ready to work from the day they leave Kenmere Charolais.

Sale Information

Inspection: Inspections will be available two weeks prior to the sale by appointment with Landmark agents Matt Pitzen and Peter Godbolt, agents Peter Ruaro, Rodwells, and Scott Campbell or Kenmere, Ann-Marie Collins and Glenn Trout. Cattle will be on display and available for inspection in the yard on sale day from 10.30AM onwards.

Lunch: Will be available on the day

Health: All sale bulls catalogued have been semen tested and examined for structural soundness. All our cattle receive 7 in 1 vaccinations and are drenched for worms and lice. All sale bulls have been DNA tested and are all PI negative.

Johne's Beef Assurance Score (J-BAS)

Kenmere has enrolled in J-BAS 7 specifically in relation to Johne's Disease and the relevant procedures for cattle. Our registered approved veterinarian has overseen the development of our bio-security plan and we have completed the triennial check test that returned negative results to Johne's disease when tested by an approved laboratory.

Raw Data: All bulls will have Scan Data available prior to the sale for eye muscle area (EMA), rump and rib fat, marbling (IMF%) as well as sale weight and scrotal measurement.

Telephone Link-Up: Mobile telephones will be available. Please arrange with the Vendor or Agent to ensure a line number is available.

Terms And Conditions: Terms of the sale are as per Conditions of Sale, NSW Stud Stock. A copy will be available sale day.

Guarantee: All stock have been evaluated for

structural soundness and fertility and to the best of our knowledge the bulls are in sound working order at the time of the sale. Any claim against a structural breakdown of any animal must be made in writing and accompanied by a Veterinary Certificate within 12 months of the sale date. Any bull failing to breed when joined at a single mating within six months of the sale may be either replaced with an animal of similar value or credit made available to the value of the purchase price, minus salvage value, for use at a future sale. The Purchaser will be responsible for any costs incurred.

Delivery: A delivery instruction slip must be completed and signed by successful purchasers. Stock awaiting delivery will be held free of charge – all care will be taken, but absolutely no responsibility will be accepted for any injury or loss considered during, as a consequence of, or in relation to any holding.

Transport: Stock carriers will be available at the sale to deliver your bulls. Please provide written instructions to the Sale Agents.

Insurance: Ownership passes at the fall of the hammer. An insurance representative will be in attendance on Sale day.

Rebate: 4% rebate will be offered to all agents on the condition that a letter of introduction is received 24 hours prior to the sale or the Agent accompanies the purchaser to the sale and settles on their behalf within 7 days. (This clause will be strictly adhered to).

PLEASE NOTE: It is unethical for anyone to promote, advertise or arrange the sale of any cattle, other than those in this sale on this sale premises.

Buy and Sell stock nationally

Auctionsplus

Auctions plus is an alternative bidding platform option if you cannot attend the sale in person. However it is only available to registered users. We recommend registering as soon as possible at least 48 hours prior to the sale.

Register at www.auctionsplus.com.au

Kenmere History

Kenmere Charolais was established in the early 1970's with original French bloodlines imported via New Zealand to Australia. This provided a genetically sound base from which we could increase numbers and quality traits that were associated with Charolais.

In 1988 John Collins changed the focus of the stud and in 2004 Matthew and Ann-Marie Collins purchased all the cattle and began the work of rebuilding the stud to the original standards set by John Collins in its inception. The Kenmere females we purchased back enabled us to breed heifers which would become the new foundation herd. We purchased quality heifers from leading studs and many of these had bloodlines that were originally Kenmere genetics.

In 2006 it was decided to recommence using the Kenmere dams for embryo transfers. Kenmere Kristina III was the first to be flushed, however with limited success in the early programmes. Kenmere Kristina III was sired by Mandalong Chock and her dam was Gilmandyke Park Kristina II.

Gilmandyke Park Kristina II dam was Kenmere Kristina the first pure bred cow bred by Kenmere in New Zealand and transported to Australia. This effectively means we are breeding animals that take us back to pure bred Charolais blood where our breeding commenced .The Kristina line commenced with 100% genetics. Today the Kristina family is well known in the Charolais breed with other reknown bloodlines originating from this line.

In 2020 we continue to breed from the Kristina bloodline and at the Melbourne Royal Show 2019 Kenmere Kristina P44E was awarded Reserve Junior Champion heifer and also was a member of the breeders group that won the All Breeds Breeders Group . Earlier in the year at the Charolais National Show 2019 Kenmere Kristina P44E won the intermediate Champion Heifer and was a member of the Breeders Group that won the event at the National. These achievements give us confidence that the quality and diversity of our genetics position us well for the future.

CHAROLAIS BREEDPLAN

January 2020 Charolais BREEDPLAN Breed Avg EBVs for 2018 Born Calves.

Percentile Range available at <http://breedplan.une.edu.au>

	CE DIR	CE DTR	GL	BW	200	400	600	MCW	MILK	SS
EBV	+1.2	+0.8	-2.5	+0.4	+12	+23	+33	+33	+7	+1.0

	CW	EMA	RIB	RUMP	RBV	IMF
EBV	+19	+1.6	+0.2	+0.3	+0.2	+0.2

\$ Index Values

Dom (\$)	Exp (\$)
+\$23	+\$31

All EBVs quoted in this catalogue are Charolais Group Breedplan EBVs and are directly comparable with the EBVs from other Charolais Group Breedplan herds.

EBVs

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These estimates are called Estimated Breeding Values (EBVs).

Accuracy

Accuracy (%) is based on the amount of performance information available on the animal and its close relatives - particularly the number of progeny analysed. Accuracy is also based on the heritability of the trait and the genetic correlations with other recorded traits. The higher the accuracy value the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives.

TRAITS

Calving Ease EBVs (%) are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

CE % Dir = Direct Calving Ease - The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

CE % Daughters = Daughters' Calving Ease - The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age.

Gestation Length EBV (days) is an estimate of the time from conception to the birth of the calf and is based on Artificial Insemination & hand mating records. Lower (negative) Gestation Length EBVs indicate shorter gestation length & therefore easier calving & increased growth after birth.

Birth Weight EBV (kg) is based on the measured birth weight of progeny, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200-Day Growth EBV (kg) is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

Mature Cow Weight EBV (kg) is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weight at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. Steer breeders wishing to grow animals out to a larger weight may also use the Mature Cow Weight EBV.

Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of the daughter's milking ability, inherited from the sire, on the 200-day weights of her calves. For dams, it indicates her milking ability.

Scrotal Size EBV (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

Eye Muscle Area EBV (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcass data, adjusted to a standard 300 kg carcass. This EBV estimates genetic differences in eye muscle area at the 12/13th rib site of a 300 kg dressed carcass. More positive EBVs indicate better muscling on animals. Sires with relatively higher Eye Muscle Area EBVs are expected to produce better muscled and higher percentage yielding progeny at the same carcass weight than will sires with lower Eye Muscle Area EBVs.

Rib Fat and Rump Fat EBVs (mm) are calculated from measurements of subcutaneous fat depth at the 12/13 rib site and the P8 rump site (from live animal ultrasound scans and from abattoir carcasses) and are adjusted to a standard 300 kg carcass. These EBVs are indicators of the genetic differences in fat distribution on a standard 300 kg carcass. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcass weight than will sires with higher EBVs.

Retail Beef Yield EBV (%) indicates genetic differences between animals for retail yield percentage in a standard 300 kg carcass. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

Intramuscular Fat EBV (%) is an estimate of the genetic difference in the percentage of intramuscular fat (marbling) at the 12/13th rib site in a 300 kg carcass. Depending on market targets, larger more positive values are generally more favourable.

Selection Indices

Charolais selection indices are calculated for market specifications, including Domestic and Export. Index values are reported as EBVs, in units of relative earning capacity (\$'s) for a given market. They reflect both the short-term profit generated by a sire through the sale of his progeny, and the longer-term profit generated by his daughters in a self-replacing cow herd. A selection index combines the EBVs with economic information (costs and returns) for specific market and production systems to rank animals based on relative profit values. More information is available on selecting animals using a selection index. The Index values are derived using BreedObject technology. More information is available from the BreedObject web site.

Domestic Index (\$) - Estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd with a British cow base (eg Angus) targeting grass-finished production for the domestic trade. This Index assumes pasture grown & finished steers weighing 430 kg (240 kg HSCW and 6 mm P8 fat depth) at 12 months. Daughters are retained or sold for breeding therefore maternal traits are of importance. In response to industry feedback, positive emphasis has been placed on finishing ability.

Export Index (\$) - Estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd with a British cow base (eg Angus) targeting the production of steers for export markets. This Index assumes pasture grown & finished steers weighing 700 kg (380 kg HSCW and 9 mm P8 fat depth) at 29 months. Daughters are retained or sold for breeding therefore maternal traits are of importance. In response to industry feedback, positive emphasis has been placed on finishing ability.

Kenmere Performance

Sale Report January 2020 Kenmere Charolais Steer & Heifer sales at Barnawatha Northern Victoria Livestock Exchange

The predictability and performance of Kenmere Genetics was again highlighted at the multi breed sale at Barnawatha on Thursday 9th January, 2020.

The Horton family presented a pen of Kenmere Charolais infused calves that won the Victorian branch of the Charolais Society award for the best presented pen of Charolais cattle sold on the day.

This is the second consecutive year Kenmere Genetics have been associated with the award validating the results our customers achieve from using Kenmere Sires. We offer our congratulations to the Horton family on their breeding achievements.

During the last year Kenmere Charolais has continued to sell weaner calves at Barnawatha and we have featured in the top quote report issued by the Northern Victoria Livestock Exchange on several occasions.

On 23 July, 2019 Kenmere sold a pen of 17 heifers at approximately nine months of age that averaged 430 kilograms for \$1,447 per head. These calves sold straight off their mothers were the top priced quote of \$3.36 per kilogram for the 400 to 420 kilogram weight group.

Later, on the 3 September, 2019 a pen of 7 younger heifers weighing an average 366 kilograms made \$1,080 per head. On the same day we sold a pen of 4 weaned steers weighing 548 kilograms for an average price of \$1,700 per head.

On October 15th, 2019 Kenmere returned to Barnawatha and sold a pen of 12 steers that weighed an average of 449 kilograms and returned \$1,349 per head. Our overall draft of 53 head during the Spring 2019 averaged \$1,220 per head. These calves are reared in true commercial conditions and in many cases, they are Charolais cross dams with multi generation Kenmere sires.

KENMERE GENETIC TRENDS

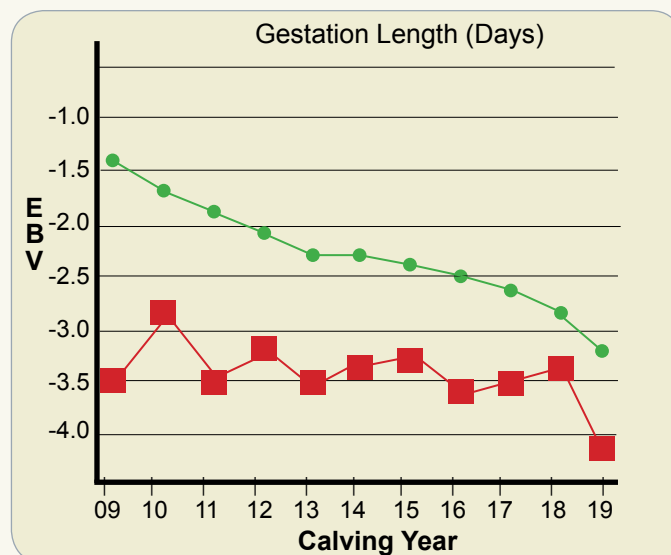

Kenmere Genetic Trends for calving traits

The real profit drivers for a profitable calf crop are live calves born early every year!

Birth Weight figures are expressed in kilograms and are calculated from the weights of the calves taken at birth and compared to the other calves in the group.

ALL KENMERE CALVES ARE WEIGHED AT BIRTH giving a great bank of actual data to start to build performance upon. With all bulls being sire verified we can be confident of the pedigree and how we can expect animal to perform and influence his progeny. Lower birth weight figures are generally more desirable.

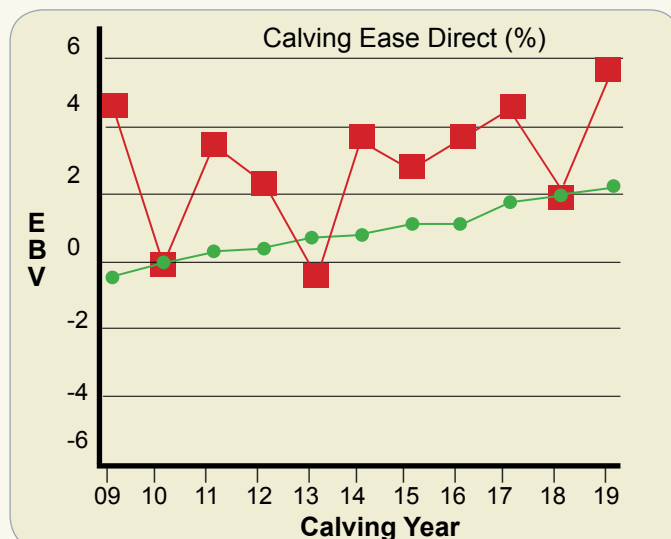

Gestation Length EBV's are an indicator of the days from conception to birth. This is important to allow cows longer to rebreed and calve on time year upon year as well as having an influence on lowering birth weight. The figure is calculated in days and a lower or lesser figure is more favourable.

Calving Ease Direct points to the calving ability of the sire's calves to be born unassisted. This means less stress on the cows, giving them a better opportunity to rebreed at the first opportunity. Higher figures are more favourable.

The other factor to keep in mind with reproductive traits, especially when mating maiden heifers is that there will be a trade off in performance when using sires with a really low birth weight figure. This is balanced by having live calves and the ability of Charolais genetics to drive weight gain, especially if you are cross breeding and getting the benefits of hybrid vigour – a win, win and a proven way to get high dollar returns.

As shown in the graphs, the Kenmere herd sits well above the breed average for Calving Ease, well below the breed average on Birth Weight and shorter than the breed average for Gestation Length.

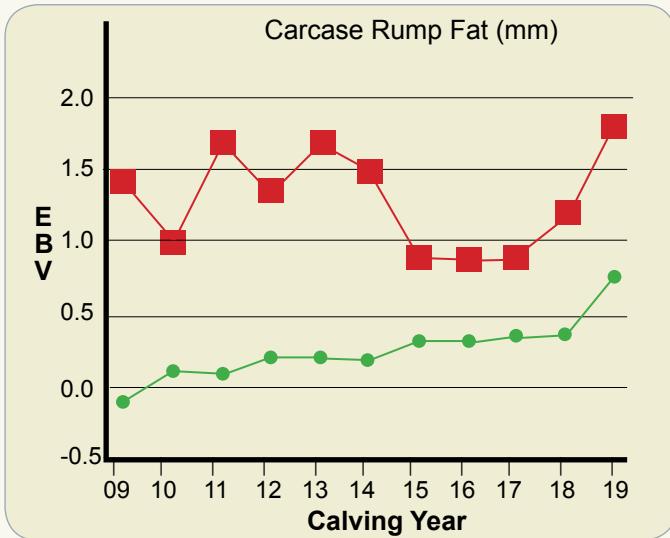

70% of the bulls in this catalogue rate in the top 20% of the breed for Birth weight, Gestation or Calving Ease Direct. The other 30% are bred for mature cow mating's based around carcase and performance traits.

It is not only the individual sire's effect but consistent, repeatable traits in the Kenmere herd as a whole.

Kenmere

Charolais Breed

Kenmere Genetic Trends for Rib, Rump and IMF

The benefits of using Charolais genetics for growth and yield coupled with ability of Kenmere bulls to lay down fat and their marbling ability make for a very sound breeding strategy.

Higher Rib and Rump fat is not only beneficial when turning off lines of cattle to fit industry requirements but for females retained that can deal with testing seasonal conditions and maintain a healthy fat score to feed their offspring and rebreed in a short space of time. This is the key to profitable beef production.

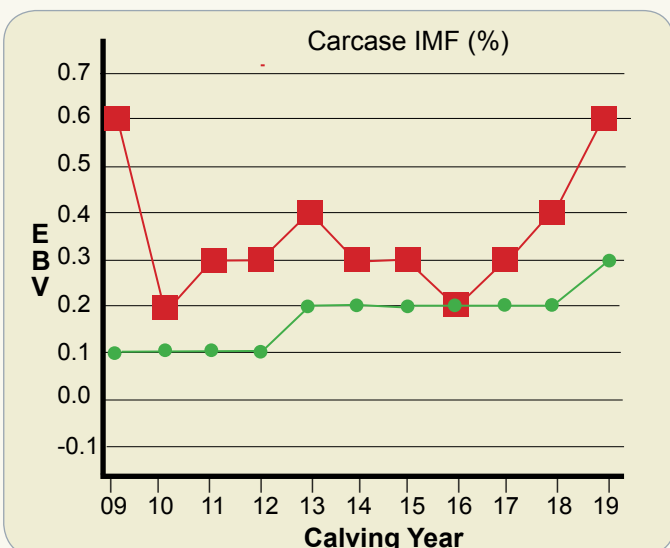

Although the sacrifice value of Charolais cross heifers is every bit as good as their male siblings, the real worth of these females is in their ability to function as highly profitable cows.

With 10 years of solid weighing and scanning data collated on the Kenmere herd of male and female progeny we can map progress of our genetics on traits not always seen by the eye and IMF is certainly one of these. Cattle that can turn grass into high weight gains and a high quality, saleable product has always been the goal for Kenmere Charolais.

Rib Fat EBVs are expressed in millimetres. They estimate the difference in the fat measurement over the rib between animals. The fat measurements that were sent to Breedplan on this set of bulls to produce these EBVs were taken in November 19, off pasture. We view a positive EBV figure to be an advantage as the progeny will be easier to finish.

Rump Fat EBVs are also expressed in millimetres. They estimate the difference in the fat measurement over the rump. Again, we view a positive EBV figure to be an advantage.

Intramuscular Fat (IMF) EBVs are estimates of genetic differences between animals in intramuscular fat (marbling) IMF EBVs are reported as differences in percentage (%) IMF. Higher IMF EBVs are more favourable and can contribute to carcass value. Sixty% of the bulls in this catalogue have Rib, Rump or IMF EBVs in the top 20% of the breed. The other bulls excel in Calving Ease or Muscularity (EMA & RBY)

As shown in the graphs the herd as a whole is built with carcass quality and fattening ability traits which makes for reliability and uniformity.

Kenmere Reference Sires

KENMERE CHOCK E12E (MCS E12E) (P)

Chock is in top 1% calving ease, top 5% for calving ease daughters, Domestic and Export indexes & milk. This bull has bred in excess of 170 progeny that are easy calving, easy doing, carry moderate frame and abundant rump. Chock is a descendant of Kenmere Kristina who was a foundation dam within our stud.

KENMERE HERICHIO (MCS H103E) (P)

Herichio is a Kenmere Bred sire who is a trait leader for 400 day weight in the breed. The bull is long bodied with adequate softness. He was the reserve interbreed champion bull at Melbourne Royal Show during his career and the bull has bred progeny that have represented the stud successfully in 2019 and 2020. Herichio should breed meaty bulls with carcass quality that will suit a variety of markets.

LT LONG DISTANCE 9001 (OAU E143E) (P)

Long Distance is in top 1% for birth weight and calving ease direct, rib and rump fat, IMF, top 5% for Gestation length and top 10% for milk. Kenmere selected this North American Sire for his worldwide acclaim for calving ease and low birthweight. He has a proven reputation for shorter gestations and good calving ease. The structure of the bull and his confirmation selectively suited mating with Kenmere dams.

PCC SPARTAN 4Y (OAC G6672E) (P)

This polled sire was bred at Prairie Cove Charolais, a leading Canadian stud stock producer. Selected as an outcross from Kenmere genetics that carries the desired softness and length of body that suits our dams. Spartan has thickness from head to tail with an impressive topline. The bull carries softness and adequate depth of rump muscle. Spartan progeny catch your eye in the paddock and are easy doing cattle.

Poll Genetics

KENMERE SYNERGY'S MAN (MCS M40E) (P)

Synergy's Man was retained by Kenmere for stud duties following his show career where he won Junior and Grand Champion Bull at Melbourne Royal Show in 2017. This sire was selected for his rib, rump and milk traits. He is a moderate framed bull packed with even thickness throughout and plenty of muscle expression. His first calves sell in this sale and are well worthy of your inspection.

VPI FREE LUNCH 708T (OAU C6773E) (P)

This international homozygous poll sire is a trait leader for Birth weight, 200, 400 and 600 day weight and scrotal size. Free Lunch has over one thousand progeny worldwide and has established a breeding reputation for siring heavily built easy doing bulls that grow consistently until full maturity.

Poll Inheritance

Understanding the Horn/Poll status of a bull is important when determining whether a potential new bull meets your breeding objectives. A poll bull can be either 'true polled' (homozygous PP), or is a carrier of horned genetics (heterozygous Ph). The polled variant of the gene (P) is usually dominant to the horned variant of the gene (h), which means polled animals may be either PP or Ph. Homozygous PP animals will always pass a copy of the polled variant to their offspring, increasing the likelihood that the offspring will be polled. Identifying breeding animals that carry two copies of the polled variant will dramatically reduce the requirement for dehorning in subsequent generations. Kenmere have tested via DNA poll animals in this sale to determine their poll status.

Genotype	Status	Explanation
PP Homozygous Polled	Polled	This animal possesses two copies of the polled variant of the gene. This animal is highly likely to be polled and will always pass a poll variant to its progeny.
Ph Heterozygous Polled	Carrier	This animal carries one copy of the polled variant and one copy of the horned variant of the gene. This animal is likely to be polled but in some instances may be scurred or horned. This animal will transmit either the horned or polled variant to its progeny.
hh Homozygous Horned	Horned	This animal carries two copies of the horned variant of the gene. This animal is highly likely to be horned and will always transmit the horned variant to its progeny.

Is polled always dominant to horned?

In Bos taurus breeds, polled is almost always dominant to horned; -PP- animals are always polled and -Ph- animals are usually always polled (they are sometimes scurred). In Bos indicus influenced breeds, such as Brahman and Droughtmaster, this is not necessarily the case. Whilst -PP animals are usually always polled, -Ph- animals can be polled, scurred and sometimes horned. For example, an Angus bull bred to horned Brahman cows will produce offspring that all have a genotype of -Ph- but can be a mixture of polled, scurred and horned. Whilst the vast majority will be polled and scurred, some horned animals are usually observed due to the influence of other genes interacting with the poll gene.

Kenmere Sale Bulls

Homozygous Poll animals in this sale have been DNA tested at Neogen and their Poll Status is indicated where a test result is available.

 CALOONA PARK UP AND UNDER (LSF U14E)

Comments: Sired by Kenmere Lanz who's dam was the much admired show cow, **Calamity**. Pivot exhibits softness with incredible muscle throughout his body. This bull has plenty to offer with his ebv's indicating his progeny will suit producers chasing rib, rump and IMF. He had the best 400 day weight ratio in the P bull drop. A **Chock** Heifers first calf! Top 10% for 200, 400, 600 day weights, Rib & Rump fat., mature cow weight and export value. Top 15% for carcass weight, IMF and domestic values. Top 20% for calving ease direct and gestation length.

Comments: Porterhouse goes back to some of Kenmere's original bloodlines - the **Que Sera** line has always been strong for milk & fertility. He has an exceptional spread of EBV's from easy birth to high growth. A big, soggy middled sire. Top 1% Scrotal. Top 5% Gestation length, 200 day weight, Domestic and Export Values. Top 10% Birth Weight. Top 15% for Calving ease direct, 400 and 600 day weights, carcass weight and IMF. Top 20% Milk, Top 25% Calving ease daughters.

Comments: Son of LT Long Distance. Undoubtedly one of the best import sires for functional progeny. Padlock is a very typical example, so easy doing, soft & sound with a moderate frame and a smooth muscle pattern. He's a heifers first calf from a very strong cow line, proven by him having the 5th highest weaning weight ratio in the drop & the 2nd highest 400 day weight ratio. Top 1% Gestation length, Top 5% Birth weight & Milk. Top 10% Rump fat & IMF. Top 15% Calving ease direct and rib fat. Top 20% Domestic and Export Values.

KENMERE NAVARRO (MCS N35D)

Comments: A long bull with a strong top line that is really wide from behind. He's from the same cow family as the Senior Champion Female at the 2019 Melbourne Royal as well as by the same Sire as the two heifers that were in the winning Interbreed Breeders Group at Melbourne 19. Pasquale was 4th best for weaning weight ratio in the P bull drop. Top 5% for 200 day wt, 15% for 600 day, top 20% for 400 day and retail beef yield.

SEDALIA YARDLEY (DEG Y13F)
 SEDALIA ANNABELLA (DEG B6E) (P)
 SEDALIA UREN FR110 (DEG U8E) (P)

Comments: Pascal is a really powerful bull that would suit vealer production. He came in third highest in the P bull drop for 400 day weight. His ebv's indicate his calves will be bell ringers on sale day from the estimated growth and indicative domestic and export suitability. A heifers first calf. Well worthy of your inspection. Top 1% for 200day, 400day, 600day, Milk, carcass weights & export index. Top 5% Gestation length, scrotal & domestic index.
