2020 NARACOORTE SHORTHORN BULL SALE

FEATURING 49 PERFORMANCE RECORDED BULLS
VET CHECKED, SEMEN TESTED, AND ZOETIS STAR ACCREDITED

Sale Thursday 26th March, 2020 at 1.00pm

Pathfinder Sale Complex, Tivers Road

18km west of Naracoorte off the Naracoorte Lucindale Road (follow the signs)

Please bring this catalogue to the sale

www.shorthornbeef.com.au

2020 Naracoorte Shorthorn Bull Sale

All vendors aim to maximise the reproductive integrity and health of their stud stock by adopting the STAR program - this is **Steps Taken Against Reproductive disease.**

Each STAR certified animal in this catalogue has been

- ❖ Tested to show that they are not Bovine Viral Diarrhoea Virus (BVDV) Persistently Infected (PI) animals
- ❖ Vaccinated against BVDV to ensure they are protected to the effects of this infection
- ❖ Vaccinated against Leptospirosis, a potential reproductive and WH&S risk for cattle handlers
- ❖ Vaccinated against Vibriosis, a sexually transmitted cattle disease
- ❖ Given 2 vaccinations to ensure they have immunity established prior to leaving these premises
- ❖ Issued with a STAR certificate – valid for 12 months

You can be confident that every step has been taken to ensure that these animals presented for sale will not introduce preventable reproductive diseases into your herd.

For more information contact Gary Glasson - 0418 812 457.

2020 NARACOORTE SHORTHORN BULL SALE

Wednesday, 25th March, 2020

All bulls must be at the Pathfinder Complex by 1.30pm.

Tivers Road, 18km west of Naracoorte off the Naracoorte Lucindale Road (follow the signs).

Weighing and scanning of bulls from 2.30pm.

SHORTHORN BEEF & WINE DINNER at the NARACOORTE FOOTBALL CLUBROOMS

The SA Shorthorn Society invites you to a tasting of Thousand Guineas beef held at the Naracoorte Football Clubrooms at 6.30pm for 7.00pm, Wednesday, 25th March, 2020.

Bookings essential – RSVP Rosemary Miller, 0427 622 252 by 19th March.

Thursday, 26th March, 2020 Bull Sale at 1.00pm

Bulls available for inspection from 10.00am.

BBQ lunch provided – *COME AND ENJOY A STEAK ON US!*

2020 NARACOORTE SHORTHORN BULL SALE

SALE TERMS & CONDITIONS

HEALTH All herds have a J-BAS 6 or better score. All bulls have been vet checked and semen tested. Bulls have been vaccinated with 7 in 1 Vibriovax & Pestiguard as per Zoetis STAR program.

BULL GUARANTEE It is a condition of sale that Vendors warrant that all bulls are to be sold as fertile and capable of natural service within 6 months of the date of the sale;

The Vendors shall refund to the Purchaser the purchase price paid (excluding any costs or expense of the purchaser) upon the Purchaser providing to the Vendor within 12 months of the sale date:-

- a) A report from a licensed veterinarian certifying that in his or her opinion:-
 - i. The bull is infertile or incapable of natural service;
 - ii. There is no evidence that the bull has suffered any injury or illness subsequent to being sold to the Purchaser which could affect his breeding ability
- b) A Statutory Declaration from the Purchaser warranting that in the opinion of the Purchaser the facts stated in the veterinarian's report are true and correct.

NUMBERS SYSTEM TO APPLY Prospective buyers and their agents must register for a buying number prior to the commencement of the sale.

- **DISCLAIMER** The Committee and/or their agents do not give any warranty as to errors and omissions if any in these particulars which they believe to be accurate when compiled. Prospective purchasers should satisfy themselves by inspection or otherwise as to the accuracy of the particulars.
- **PUBLIC LIABILITY** Any person attending the sale does so at his/her own risk. All persons attending the sale release the Committee and vendors from all actions and demands due to any loss, death, damage or injury occurring on the premises. The Committee and vendors are not responsible and have no liability for any death, or injury to any person or any loss of, or damage to any person attending the Sale, their property or otherwise.
- **INDEMNITY** All persons attending the sale agree to indemnify the Committee or vendors from and against any liability, loss, damage, expense or claim which the Committee or vendor may incur, including to a third party, during or after the Sale in all respects.

OUTSIDE AGENTS REBATE A 3% rebate is offered by the vendors to all outside agents who register in writing 24 hours prior to the sale, purchase and pay within the terms of settling agent.

THANK YOU TO:

**Castec for donating the product awarded to the buyer of the highest priced bull.
Zoetis for donating product awarded to a buyer in the lucky draw.**

EBVs

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These estimates are called Estimated Breeding Values (EBVs).

In the calculation of EBVs, the performance of individual animals within a contemporary group is directly compared to the average of other animals in that group. A contemporary group consists of animals of the same sex and age class within a herd, run under the same management conditions and treated equally. Indirect comparisons are made between animals reared in different contemporary groups, through the use of pedigree links between the groups.

EBVs are expressed in the units of measurement for each particular trait. They are shown as +ive or -ive differences between an individual animal's genetics difference and the genetic base to which the animal is compared. For example, a bull with an EBV of +50 kg for 600-Days Weight is estimated to have genetic merit 50 kg above the breed base of 0 kg. Since the breed base is set to an historical benchmark, the average EBVs of animals in each year drop has changed over time as a result of genetic progress within the breed.

The absolute value of any EBV is not critical, but rather the differences in EBVs between animals. Particular animals should be viewed as being "above or below breed average" for a particular trait.

Whilst EBVs provide the best basis for the comparison of the genetic merit of animals reared in different environments and management conditions, they can only be used to compare animals analysed within the same analysis. Consequently, Shorthorn BREEDPLAN EBVs cannot be validly compared with EBVs for any other breed.

EBVs are published for a range of traits covering fertility, calving ease, Milking ability, growth and carcass merit. When using EBVs to assist in selection decisions it is important to achieve a balance between the different groups of traits and to place emphasis on those traits that are important to the particular herd, markets and environment. One of the advantages of having a comprehensive range of EBVs is that it is possible to avoid extremes in particular traits and select for animals with balanced overall performance.

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These are called Estimated Breeding Values (EBVs). They are expressed as the difference between an individual animal's genetics and the genetic base to which the animal is compared.

CALVING EASE EBVS (%) are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

-CE % DIR = Direct Calving Ease – The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

-CE % DAUGHTERS = Daughters' Calving Ease – The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age.

GESTATION LENGTH EBV (days) is an estimate of the time from conception to the birth of the calf and is based on AI records. Lower (negative) GL EBVs indicate shorter gestation length and therefore easier calving and increased growth after birth.

BIRTH WEIGHT EBV (kg) is based on the measured birth weight of progeny, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200-DAY GROWTH EBV (kg) is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-DAYS WEIGHT EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-DAYS WEIGHT EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

MATURE COW WEIGHT EBV (kg) is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weights at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. The Mature Cow Weight EBV may also be used by steer breeders wishing to grow animals out to a larger weight.

MILK EBV (kg) is an estimate of an animal's Milking ability. For sires, this EBV indicates the effect of the daughter's Milking ability, inherited from the sire, on the 200 Days Weights of her calves. For dams, it indicates her own Milking ability.

SCROTAL SIZE EBV (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in females progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

DAYS TO CALVING is an estimate of genetic differences between animals in the time from the start of the joining period (ie. when the female is introduced to a bull) until subsequent calving. Days to Calving EBVs are expressed in days and are calculated from the joining records submitted for both heifers and mature cows.

UNDERSTANDING EBVS, INDEXES & ACCURACY

CARCASE WEIGHT EBV (kg) is based on abattoir carcass records and is an indicator of the genetic difference in carcass weight at the standard age of 650 days.

EYE MUSCLE AREA EBV (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcass data, adjusted to a standard 300 kg carcass. This EBV estimates genetic difference in eye muscle area at the 12/13th Rib site of a 300 kg dressed carcass. More positive EBVs indicate better muscling on animals. Sires with relatively higher EMA EBVs are expected to produce better muscled and higher percentage yielding progeny at the same carcass weight than will sires with lower EMA EBVs.

RIB FAT AND RUMP FAT EBVS (mm) are calculated from measurements of subcutaneous fat depth at the 12/13th Rib site and the P8 Rump site (from live animal ultrasound scans and from abattoir carcasses) and are adjusted to a standard 300 kg carcass. These EBVs are indicators of the genetic differences in fat distribution on a standard 300 kg carcass. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcass weight than will sires with higher EBVs.

RETAIL BEEF YIELD EBV (%) indicates genetic differences between animals for retail yield percentage in a standard 300 kg carcass. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

INTRAMUSCULAR FAT EBV (%) is an estimate of the genetic difference in the percentage of intramuscular fat at the 12/13th Rib site in a 300 kg carcass. Depending on the market targets, larger more positive values are generally more favourable.

SELECTION INDEXES

Shorthorn selection indexes are calculated for two market specifications, namely, Domestic and Japanese. There are 2 Indexes for the domestic market specifications with each Index applying different weighting to calving ease. The Domestic Indexes and the Export Maternal Index relate to typical self-replacing Shorthorn herds in temperate Australia targeting these specifications. Indexes are reported as an EBV, in units of relative earning capacity (\$'s) for a given market. They reflect both the short-term profit generated by a sire through the sale of his progeny, and the longer term profit generated by his daughters in a sustainable cow herd. Therefore, a proportion of heifers bred in the herd will be retained for breeding.

The SB3 Carcass Index relates only to production of steers for the mid-fed Japanese export market. This Index concentrates on selecting bulls that will produce these steers and, as such, ignores many important considerations for breeding, such as the maternal traits and calving ease. For bull selection the other Indexes, that value all aspects of performance, should be used. Indexes are derived using the BreedObject technology. For more information go to the BreedObject web site.

HEAVY DOMESTIC INDEX (DOM) – Estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd in a temperate environment targeting pasture grown and finished steers for the domestic trade (eg supermarket). Steers are marketed at 480 kg live weight (260 kg HSCW and 10 mm P8 fat depth) at 22 months of age. Daughters are retained for breeding.

SELECTION INDEX VALUES	
Market Target (\$)	Breed Ave.
Domestic Maternal	+\$35
Export Maternal	+\$37
Northern Maternal	+\$44

UNDERSTANDING EBVS, INDEXES & ACCURACY

EXPORT MATERNAL INDEX (EXP) – Estimates the genetic differences between animals in net profitability per cow joined for an example commercial herd (self replacing herd run in a temperate environment) targeting steers for the Japanese B3 market. Steers are assumed to be pasture grown to feedlot entry then feedlot finished for 150 days. Steers are assumed to be marketed to the feedlot at 450 kg live weight, and then slaughtered after finishing at 675 kg live weight (370 kg HSCW).

SB3 CARCASS INDEX (SB3) – Estimates the genetic differences between animals in net profitability for an example commercial herd targeting steers that meet the requirements of the feedlot and processing industry for the Japanese export market. Steers are assumed to be pasture grown to feedlot entry then feedlot finished for 150 days. Steers are assumed to be marketed to the feedlot at 450 kg live weight, and then slaughtered after finishing at 675 kg live weight (370 kg HSCW). This Index was primarily developed for selecting sire lines of steers entering a long-fed feeding program. Caution should be taken when using this Index in bull selection as no consideration has been made for important traits, such as birth weight, calving ease or the maternal traits. All selection indexes are reported as an EBV, in units of net profit per cow mated (\$) for a given production/market scenario. They reflect both the short term profit generated by a sire through the sale of his progeny, and the longer term profit generated by his daughters in a self replacing cow herd (where applicable).

Note that \$Index Values for individual animals are sensitive to the assumptions used in the BreedObject analysis to calculate the selection index. For more information on these assumptions and weightings go to the Shorthorn Society web site.

ACCURACY (%) is based on the amount of performance information available on the animal and its close relatives – particularly the number of progeny analysed. Accuracy is also based on the heritability of the traits and the genetic correlations with other recorded traits. Hence accuracy indicated the “confidence level” of the EBV. The higher the accuracy value the lower the likelihood of change in the animal’s EBV as more information is analysed for that animal or its relative. Even though an EBV with a low accuracy may change in the future it is still the best estimate of an animal’s genetic merit for that trait. As more information becomes available, an EBV is just as likely to increase in value, as it is to decrease.

Accuracy values range from 0-99%. The following guide is given for interpreting accuracy:

RANGE	INTERPRETATION
< 50%	EBVs are preliminary and could change substantially as more performance information becomes available.
50 - 74%	Medium accuracy, usually based on the animal’s own records and pedigree.
75 - 90%	Medium-high accuracy. Some progeny information included. EBVs may change with addition of more progeny data.
> 90%	High accuracy estimate of the animal’s true breeding value.

As a rule, animals should be compared on EBVs regardless of accuracy. However, where two animals have similar EBVs the one with higher accuracy could be the safer choice, assuming other factors are equal.

For further information please contact the Shorthorn Society or BREEDPLAN.

TOYOTA

TOYOTA HILUX

Australia's #1 selling vehicle for a reason

Since its introduction in 1968, the iconic Toyota Hilux has achieved more than 1 million vehicle sales in Australia. Its uncompromising combination of off-road capability, urban credibility and premium style has made it Australia's most popular vehicle for 3 years running. And in 2018, it took out the coveted trifecta by being crowned Australia's #1 selling vehicle, #1 selling ute and #1 selling 4x4. When it comes to tough Australian conditions, the Toyota Hilux is in a class of its own. And more than 50 years on, its Unbreakable reputation is showing no signs of slowing down.
