Auctions Plus Helmsman sale
30 bulls
40 heifers PTIC in lots of 10

inspection well prior to sale day encouraged

All bulls never fed grain or pellets
All bulls vaccinated with 7 in 1
Pestivirus free herd by vaccination
Bulls delivered free locally
No bulls were assisted at birth
No foot trimming

See our written guarantee on pages 10-11

Hello Breeders

What interesting times we are in. At the time of writing we don't know what changes will be upon us tomorrow or the next day. With some trepidation we have decided to run this year's Helmsman sale online on Auctions Plus. Nutrien Livestock (Landmark) will be the agent.

For those who are familiar with Auctions Plus you will not have a problem with this. For those who are not familiar with the process you can EITHER

a) Arrange to bid by phone through any Nutrien or other agent.,

b) contact us to arrange it for you,

c) Register with Auctions plus, log on, and bid online.

If you choose the latter I suggest you register well prior to the sale and log onto some previous sales in order to become familiar with the process.

In order to reduce personal contact, we encourage all, particularly senior persons, to inspect the bulls and heifers well prior to the sale by contacting us, and for not too many to turn up on sale day. I never thought I would say that. Photos and videos of each lot are available on our website.

When I attended school a wise teacher said, "It is not my job to teach you stuff, but to teach you to think for yourself." Along these lines I wanted to reflect on 35 years of Breedplan and seasonal conditions of late. Genetics and performance are two words continually bandied about our industry. The question for me is how much performance is necessary or desirable, as many of these traits come with a cost. The costs fall heavily on your breeding herd.

I heard this comment from an Angus stud breeder recently. "The best thing about this drought is that it has got rid of all those BIG cows." Meaning of course that they didn't get back in calf. I absolutely concur. There are no free lunches. As growth and milk increase, cows become leaner and harder to keep. If cows become leaner fertility drops dramatically. In particular over the last

three drought years we have noticed that, for the most part, our earlier maturing cows and heifers (read lower growth) have joined earlier and at lower weights than their later maturing counterparts and less of them are on the truck after preg testing than the later maturing types.

So how much performance is enough? I believe you should work back from the end product. Most carcass grids these days have a sweet spot between 280 and 340 kg which equates to a steer around 600 kg live. Given that steers grow bigger than cows I would say that a 500 to 600 kg cow is more than capable of providing you with a steer to meet market specs, and that if your cows are any bigger than that it may be costing you serious money, as they may be harder to keep and you could be running more cows of an earlier maturing better doing type.

The problem is, that as studs have striven for more and more performance, this moderate sized breeder capable of giving you that 600 kg steer, has genetics that now put it comfortably below breed average for performance. How do you promote that???

We always welcome feedback from our clients and in the last few years a number have told us that the progeny of their earlier maturing bulls are finished and sold long before the later maturing types. Another interesting observation from the last couple of years is this. In his commercial operation our son Peter has obtained some good quality Angus cows and bred them to Hereford bulls. The interesting thing is that, when run in the same mob, the Hereford cows have maintained their condition better than either the Angus or Angus cross cows, and as a result have returned noticeably better conception rates. So cheer up, and think for yourself. Cattle breeding is full of compromises and moving goal posts. While the grass may look greener over the fence, you are probably doing just as well as they are.

*Best regards
Michael Rutherford*

SALE ARRANGEMENTS

Auctions Plus Helmsman Sale 1:00 pm, Inspection well prior to sale day encouraged

A rebate of 2% for bulls and 1% for heifers to outside agents introducing buyers prior to the sale and settling within seven days.

Supplementary sheet will be available on sale day.

HELMSMAN SALE Online only

AUCTIONS PLUS terms and conditions apply
www.auctionsplus.com.au

1. All lots are on the market simultaneously.
2. You may bid on any lot or lots at any time during the sale.
3. Each lot will have a starting price and bidding will commence at that price.
4. Bids for bulls will be \$250 and heifers \$25

THE BENEFITS

1. You have more time to consider your bids. You can bid on any lot at any time, no pressure to make that instant decision.
2. You have time to reassess during the sale. If your 1st choice goes beyond your budget, you still have access to any other lot.

Inspection well prior to sale day highly encouraged.

Bulls and heifers will be yarded on property from 10:00 am

Bidding will be online or phone only

Nutrien Livestock will be in attendance

STANFORD POLL HEREFORDS

The Rutherford and previously Gardiner families have bred registered Poll Hereford cattle since 1957. The Stanford prefix was established in 1974 with a base of Hopetoun and Sandalwood females. The Stanford and Hopetoun Stud's were merged in the mid 1980's. Genetics to have a significant influence since then have come from Wyregal, South Bukalong, Boonah, Wynella, Croft Ambrey, Lachlan Dale, Llandillo, Billillingra, Rotherfield and Oldfield studs.

The herd has been performance recorded with breedplan since 1985 with the early adoption of ultra sound scanning. Our herd was awarded a Certificate of Excellence in the NSW Seedstock Producer of the Year competition both times that we participated.

Today we run over 250 stud and 250 commercial breeders. We breed cattle entirely for their commercial attributes. We do not show them as we prefer to focus on productive traits. We have been calving our heifers at 2 years of age for many years and any female not joining in 9 weeks or requiring assistance is culled. Our cattle are selected for fertility, calving ease, structural soundness, performance and market suitability and have generations of inbuilt productivity. Most of our fat cattle are sold over the hook or direct to feedlots.

All calves are weighed at birth, weaning, yearling and again at 18 months. They are also scanned for fat depth, eye muscle area, and intramuscular fat percentage. All bulls are measured for scrotal size as yearlings and again before sale.

Although most calves are sired naturally, we have a well established annual A.I. program to trial new bloodlines.

SUCCESS WITH STEERS

Steers from Stanford have performed well above average in the Australian National Field Days Steer Trial comprising both grass and grain feeding. Over three trials our steers have been awarded prizes for 1st , 2nd and 3rd place pen of three carcasses and 1st, 2nd and 4th place for weight gain on grain. Importantly these results were achieved against all breeds and their crosses. Consistency counts.

FERTILITY AND STRUCTURAL SOUNDNESS

This should be your most important consideration when selecting bulls. Our sale bulls have been inspected by Blayney Veterinary clinic. This included feet, legs, eyes, jaws, testes, sheath, and penis. A service test has not been included this year as time has not allowed, however we, of course, still guarantee them capable of doing the job.

Our bulls are entirely pasture reared as this has proven to extend working life in your herd by up to two years over grain fed bulls, according to work done by Dr Mike Blockey. We believe that your grass fed bulls shouldn't reach maximum mature weight before four years of age. If your bull only weighs 700kg at 2 years, relax, as long as he is fit and healthy you are well on the way to owning a very profitable bull as he is likely to last longer than a heavier bull.

POLL / HORN STATUS

The Sale bulls have been DNA tested for Poll/Horn status. Bulls with (PP) in the lot heading are PURE POLL. Bulls with (Ph) or (S) are heterozygus poll. Bulls with (P) were not tested.

BREEDPLAN EBV's

Group Breedplan provides the most accurate reports on production traits available to the industry. In fact, Group Breedplan is the only valid method for comparing cattle from different herds for growth, milk and carcass traits. The practice of comparing actual weights or carcass scans of animals from different herds is meaningless as most of the differences will be caused by factors such as type of country, climate, stocking rate and feeding regimes. Group Breedplan can save you heaps by identifying the actual genetic growth potential in grass fed bulls. The assessment of an animals genetic make up is expressed as an Estimated Breeding Value or EBV measured in Kg liveweight. It is based on an animals own comparative performance plus that of its relatives, while taking into account environmental effects. The figures shown here can be directly compared with those of other participating Poll Hereford Group Breedplan herds.

CALVING EASE EBV's are based on birth weight and calving ease recorded at birth. They will range from about -10 to +10 with the more positive EBV 's indicating easier calving. Use these when selecting heifer bulls.

BIRTH WEIGHT EBV's may be used to advantage in reducing calving problems in your heifers; the lower figures being more desirable. These should be used in association with such physical characteristics as smooth shoulders and finer bone. Ask us about Heifer bulls, a percentage of our bulls are now bred specifically for heifer joining, and we can advise you on the most likely prospects.

MILK Breedplan is able to split pre weaning performance into growth and milk genes. The EBV for milk in a bull represents the potential for him to pass on milking ability to his daughters. More milk in your cows can help you produce heavier, sappier vealers or reach market weight sooner. Too much milk however, can lead to more dry cows in a bad year, higher rates of udder breakdown in a good year, and more grass tetany problems.

GROWTH 200, 400 & 600 day growth EBV's are a measure of an animals inherent ability to grow to weaning, yearling and older weights, providing feed is available. More growth can help you reach target weights sooner or sell heavier cattle at the same age, however you may also find them harder to finish at younger ages. Larger breeding cows also require more feed than more moderate cows.

CARCASS

Rump fat EBV's expressed in mm, and eye muscle area EBV's expressed in square cm are derived from ultrasound scanning conducted on all yearlings. Visual muscle score will also prove useful. More muscular carcasses with the right amount of fat cover achieve significant premiums in the market place, currently about 20 cents / kg for each increase of one visual muscle score. Note, visual muscle score is a better indicator of carcass yield than EBV's.

IMF (Intramuscular Fat) % EBV is the estimate of the genetic difference in the percentage of IMF at the 12/13th rib on a 300kg carcass - more positive values would be favourable for the Japanese market, and for meat quality in general.

AN IMPORTANT MESSAGE ABOUT GROWTH

On most properties with standard or higher stocking rates the main limiting factor for cattle growth rates is either feed availability (usually autumn and winter) or feed quality (summer and autumn) , assuming parasites have been controlled. This leaves only 3 to 4 months of each year when cattle can grow to their potential. For the remaining 8 months of each year they can only grow as fast as the limited quantity / quality of feed will allow – **No matter what their potential growth rate is.**

You will also find that the greater the gap between their potential growth rate and that allowed by the limited quantity / quality of feed, then the leaner the animal will become when put under stress such as calf rearing / cold winters etc.

This has serious implications for your breeding herd which

on most farms will consume 70 to 80 % of feed grown for the cattle enterprise. If the growth potential of your herd exceeds the feed base provided to it by too much then **leanness becomes a problem for 8 months of the year and herd fertility will suffer**. The effect will be greatest on your heifers calving at 2 years.

You then have two choices

1. Reduce your stocking rate substantially. (ouch.) or
2. Try to match the cattle more closely to the environment.

Let's face it ; to be serious in cattle breeding these days you really have to be calving at 2 years in spring and you have to be thinking in terms of Kg / Ha , not Kg / head.

If you think you can identify with this message then you will realize that bigger is not necessarily better when it comes to growth EBV's. There are no free lunches, bigger cattle need more feed.

Before Breedplan we used to call it constitution or doing ability or in another way, early / late maturity patterns. What is the point in having 700 kg steers that still aren't finished. Their sisters will really struggle as they won't carry enough fat.

In our commercial operation we find that all the higher priced markets available to us can be adequately supplied using moderate growth bulls whilst also keeping cow size sensible.

Breed avg. EBVs for 2018 Born Calves

YOUR GUARANTEE
NOW COMES IN TWO PARTS

PART 1

Fertility

(valid for 12 months following purchase)

We guarantee that our bulls are capable (excluding injury or disease occurring after purchase , and assuming you have kept him in good working condition) of achieving conception rates of 90% (85% for autumn and early winter calving herds) when mated to their potential for ten weeks, providing your cows are healthy and cycling. If your bull does not produce the expected number of calves or pregnancies as a result of the failure of his own fertility (Vet. certificate required), we will:

- replace him with a bull of equal value at no charge.
- Give you a credit to the tune of \$50 for each empty cow (up to the guaranteed level).

PART 2

Structural soundness (valid for 2 years following purchase)

The average working life of a bull in south eastern Australia is three years. While we make every endeavor to ensure that all bulls sold are sound, it is often difficult to foresee how a young bulls feet, hips etc. will perform in the years ahead.

We are prepared to guarantee that you will get at least the average three seasons from our bulls and it works like this:

Assuming your bull completes his first mating successfully, but presents in an unsound condition for his 2nd (due to feet, leg or hip problems not caused by injury or disease) we will provide you with a bull of equal value at a 60% discount. If at the end of 2 years your bull, having completed 2 successful matings, presents in an unsound condition prior to his 3rd mating, we will provide you with a bull of equal value at a 30% discount, thus ensuring that you receive the full value of your original purchase.

Remember, if for any reason you are disappointed with your purchase, please let us know, and we will do our best to help. With this type of feedback, you can help us to produce a better article
