ONSLow'S PHILOSOPHY

The Onslow philosophy still remains as it has been since the stud's inception:

1. Use good commercially orientated sires.
2. Keep the females fertile, feminine and functional.
3. Keep practical pressure on all resultant progeny.

Since settling our operation into Wallendbeen we have expanded our commercial operation to the extent we feel our offering and presentation of bulls each year is becoming more and more commercially focused.

BREEDPLAN

Breedplan is the most significant aid to cattle breeders developed in my time. Used as an aid to the breeder, EBV's enable predictability to be gauged into a program. At present, in my opinion and in some instances, we see EBV's being marketed at the expense of some of the commercial traits. Firstly and foremost we must evaluate structure, length, thickness and balance and the reproductive organs, and then evaluate the EBV's to our preferred numbers. Australian Angus Breeders must embrace the top performing sires and mate with the superior females and breed ANGUS that are suitable for the environment and have the phenotype, constitution and the balanced traits to perform for commercial breeders. We must have confidence in our cattle and our programs! One of my concerns after talking to many commercial breeders is where some

Over the years at Onslow we have built our herds on generations of performance, cattleman's eye and culling for the obvious – fertility, feet and doing ability. Our lists of achievements exemplify the performance of our cattle over an extended period. We believe our cattle to be honest, hard working and applicable to the industry with the performance for today's elusive market specifications. Through a common sense approach, selecting for the basics, the use of technology and maintaining a balanced program we are well placed to provide clients a strong link to the industry..

stud breeders, academics and marketing is taking us in relation to EBV's and \$ Indexes. Some imported bulls have reinvented Angus through their type, consistency and commercial acceptance whilst many others have a negative influence through their feet, testicles, doing ability and consistency. Skin and hair are great indicators of softness and doing ability which are necessary in our diverse environment. \$ Indexes indicate various combinations for applicable markets devised by academics. Too many new and younger breeders accept these as the ultimate in decision making. There is a need for a readjustment in the thinking on breeding Angus cattle to fit into the environment and market place for sustainable and profitable breeding programs.

\$INDEX VALUES AND EBVs

Accuracy (%) - Provides an indication of the reliability of an EBV. As more performance information becomes available on an animal (or it's progeny, or relatives) then the accuracy of it's EBVs for particular traits will increase.

Calving Ease DIR (%) - Estimates of the genetic differences between animals in the ability of their calves from 2 year old heifers to be delivered without assistance.

Calving Ease DTRS (%) - Estimates of the genetic differences between animals in the ability of their 2 year old daughters to calve without assistance.

Gestation Length (Days) -- Estimates of the genetic differences between animals in the number of days from the date of conception to the calf birth date,

Birth Wt (kg) -- Estimates of the genetic differences between animals in calf birth weight

200-Day Wt (kg) - Estimates of the genetic differences between animals in liveweight at 200 days of age.

400-Day Wt (kg) - Estimates of the genetic differences between animals in liveweight at 400 days of age.

600-Day Wt (kg) -- Estimates of the genetic differences between animals in liveweight at 600 days of age.

Mature Cow Weight (kg) - Estimates of the genetic differences between animals in cow weight at 5 years of age.

Milk (kg) - Estimates of the genetic differences between animals in milk production, expressed as variation in 200-day weight of daughter's calves.

Scrotal Size (cm) -- Estimates of the genetic differences between animals in scrotal circumference at 400 days of age.

Days to Calving - Estimates of the genetic differences in female fertility, expressed as the number of days from the start of the joining period until Subsequent calving,

Carcase Weight (kg) -- Estimates of the genetic differences between animals in carcass weight, adjusted to 650 days of age.

Eye Muscle Area (cm²)~ Estimates of the genetic differences between animals in eye muscle area at the 12|13th rib site, in a 300kg carcass.

Rib Fat (mm) - Estimates of the genetic differences between animals in fat depth at the 12|13th rib site, in a 300 kg carcass,

Rump Fat (mm) - Estimates of the genetic differences between animals in fat depth at the P8 rump site, in a 300kg carcass,

Retail Beef Yield 96 (RBY%) -- Estimates of the genetic differences between animals in percentage retail beef yield, in a 300kg carcass,

Intra-Muscular Fat (IMF%) -- Estimates of the genetic differences between animals in percentage intra-muscular fat (marbling) at the 12|13th rib site, in a 300 kg carcass

Trial Net Feed Intake (NFI) - Estimates of the genetic differences in feed intake for animals adjusted to the same growth rate and weight base.

Angus Breeding Index - estimates the genetic differences between animals in net profitability per cow joined in a typical commercial self replacing herd using Angus bulls. This selection index is not specific to a particular production system or market end-point, but identifies animals that will improve overall profitability in the majority of commercial grass and grain finishing beef production systems. This selection index is particularly suited to commercial producers who sell progeny into different markets, or to seedstock producers supplying bulls to commercial clients who produce for a range of different production systems and market end points.

Domestic index - estimates the genetic differences between animals in net profitability per cow joined in a commercial self replacing herd targeting the domestic supermarket trade. Steers are assumed to be finished using either grass, grass supplemented by grain or grain (eg. 50 — 70 days) with steers slaughtered at 490 kg live weight (270 kg carcass weight with 12 mm P8 fat depth) at 16 months of age. Daughters are retained for breeding and therefore maternal traits are of importance. Emphasis has been placed on eating quality and tenderness to favour animals that are suited to MSA requirements.

Heavy Grain Index - estimates the genetic differences between animals in net profitability per cow joined in a commercial self replacing herd targeting pasture grown steers with a 200 day feedlot finishing period for the grain fed high quality, highly marbled markets. Steers are assumed to be slaughtered at 760 kg live weight (420 kg carcass weight with 30 mm P8 fat depth) at 24 months of age. Daughters are retained for breeding and therefore maternal traits are of importance. There is a significant premium for steers that exhibit superior marbling.

Heavy Grass Index - estimates the genetic differences between animals in net profitability per cow joined in a commercial self replacing herd targeting pasture finished steers. Steers are assumed to be slaughtered at 620 kg live weight (340 kg carcass weight with 12 mm P8 fat depth) at 22 months of age. Daughters are retained for breeding and therefore maternal traits are of importance. Emphasis has been placed on eating quality and tenderness to favour animals that are suited to MSA requirements. All selection index values have been derived using BreedObject technology.

If you have any further queries regarding Angus Selection Indexes, please do not hesitate to contact staff at BREEDPLAN.

BULL LIBIDO

Bull libido should not be mis-interpreted as bad temperament.

Bulls need to have a high libido, alas, this sometimes makes them aggressive to other bulls. In a Bull Sale situation where young strong bulls are enclosed in small areas their pecking order is challenged. Some bulls are ever alert to what their mates are thinking, hence, the unfamiliar onlooker might think the bull is anxious to them when in fact the bull is only concerned about getting attacked by one of his mates.

EXPLANATORY NOTES

There is a lot of data on cattle available to breeders today, however, some facts can become distorted and not kept in perspective. One such trait is Birth Weight. We are given figures and EBV's; however they are Estimated Breeding Values not ACTUAL. We acknowledge the correlation between higher birth weight and dystocia but also place great emphasis on shape. To illustrate examples; one previous Onslow Sire with 861 progeny recorded, had a birthweight of +4.5 with 98% accuracy and gave more problems than Vena Park Sharka at +10.8. After many hours studying a combination of examples we have come to the conclusion that EBV's, shape and common sense are the best ways to approach calving issues. Studies were in varied forms and one

evaluation came at an odd time, about 11pm over the dinner table with wine bottles (all empty!) and all weighing the same with the same capacity of 750mls. Everyone agreed that these wine bottles demonstrated the IMPORTANCE OF SHAPE

At Onslow we do not weigh our calves at birth because I am too old and slow and we do not have the workforce to do it.

SALE PREPARATION

Since last Sale, seasonal conditions have changed for the better. The older bulls grazed on pasture and Lucerne paddocks, then onto grazing canola until we had losses one frosty night. Since mid-June they have had access to grazing oats and over the last few weeks they have been fed some oaten hay.

The Q bulls were weaned early onto pasture and barley straw, and then had access to summer crops. Again they grazed on canola with losses also. The yearlings were weaned at 2 and a half to 3 and a half months then went onto pasture and later had access to grazing oats.

They have only been supplemented with oaten hay over the past four weeks.

GUARANTEE

Onslow guarantees the structural soundness and fertility of all the bulls. The entry of every bull constitutes a guarantee by the vendor that if a bull should prove infertile or breaks down due to reasons other than injury, misadventure or negligence, Onslow will provide you with a satisfactory replacement if available, or issue you with a credit equal to the purchase price minus salvage value. This credit may be used to purchase any animal in future Onslow sales.

Any request for replacement/credit must be lodged with the vendor within 12 months of purchase.

TAKING DELIVERY OF YOUR NEW BULL

All Onslow Bulls are run in large mobs all their life, so they have always had plenty of mates around and have never been alone. A Bull leaving Onslow is leaving the security of a large mob and will arrive in unfamiliar territory at your property. It is a good idea to have some of your own cattle in the yards when your bull/s arrive, a handfull of Steers or PTIC Cows to keep them company whilst they survey their new surroundings.

Never try to move a bull on his own, especially in unfamiliar surroundings, always have a companion for him.

A young Bull can move in with older Bulls and settle in well, but remember, being the youngest he will get the last of the feed available because of the pecking order. The paddock needs to be reasonably large so he can keep away from the others and find adequate feed. Young Bulls are still growing fast and need enough feed to maintain their growth pattern and be able to settle the Cows quickly and efficiently. Onslow Angus Bulls are accustomed to being handled by Stockmen on 4 wheel bikes with dogs. Most of the fences are electrified and the Bulls treat them with respect. Always be considerate to your Bull and handle him with respect and kindness. You will find that he will reciprocate and will be much easier to manage.

LOOKING AFTER YOUR NEW BULL

After purchasing your bull, please ensure you fill out the buyers instruction sheet which includes delivery instructions. The sale bulls have been prepared so that they are ready to go to work with your cows.

Onslow bulls are used to being handled with bikes, vehicles and respond to working dogs. When your new bull is joined to your cows, inspect him at least weekly to ensure he is walking freely and his penis appears to be normal. If there is a problem take him out of the cows and report to a vet. Early treatment is vital. It is a good idea to have spare bull(s) ready to work if a problem(s) When joining is finished, the bull would appreciate a drench and a lice treatment. The minimum vaccinations required are an annual dose of vibriosis and 7 in 1 commencing no later than April next year. In some areas other vaccination may be required. If you have any questions regarding the bulls, the progeny etc please let us know.

Thank you for having faith in the Onslow Breeding Programme.

**Introducing our New Enterprise -
Onslow Australian Whites**

INSURANCE

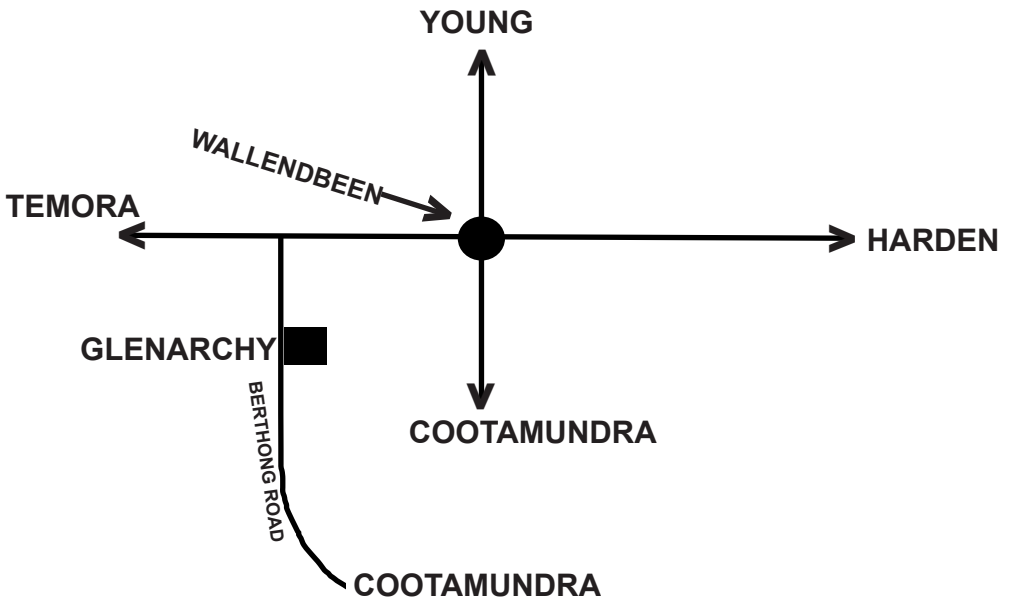

Facilities for insurance will be available at the sale.

HEALTH

All Lots were drenched in June - 7 in 1, Pestiguard and Vibrio Farm Biosecurity JBAS6.
