Friday 21st August, 2020 - Commencing at 12pm

**Waroona
550 Packham Drive
MOLONG NSW 2866**

13 Stud Bulls 12 Stud Females 20 PTIC Commercial Heifers

Waroona Murray Greys Production Sale

Friday 21st August, 2020 - Commencing at 12pm

**Waroona
550 Packham Drive
MOLONG NSW 2866**

**Waroona Murray Grey Stud
Graham Hobbs**
M: 0429 076 617
E: g.khobbs@bigpond.com

AGENT
Kevin Miller, Whitty, Lennon & Co.
106 Lachlan Street
Forbes NSW 2871
Ph: 02 6852 3355
<http://www.kmiller.com.au/>
Luke Whitty - M: 0427 524 442

Cattle available for inspection 10am on sale day or prior by arrangement with vendor.

Light refreshments and lunch provided.

Numerous accommodation options in Molong and Orange.

The buyer friendly **Helmsman system** is being used where bids are placed over time and all lots knocked down together (see details under Sale). Enables us to talk to everyone and enjoy the day also.

EBV's Explained

Calving Ease Direct: Calving Ease (DIR) EBVs are estimates of genetic differences in the ability of a sire's calves to be born unassisted from 2 year old heifers.

Calving Ease Daughters: Calving Ease (DTRS) EBVs are estimates of genetic differences in the ability of a sire's daughters to calve at 2 years of age without assistance.

Gestation Length: Gestation Length EBVs are estimates of genetic differences between animals in the number of days from the date of conception to the calf birth date.

Birth Weight: Birth Weight EBVs are estimates of genetic differences between animals in calf birth weight. Calf birth weight is the biggest genetic contributing factor causing calving difficulty in heifers. Please note, whilst low Birth Weight EBVs are favoured for calving ease they are also generally associated with lower overall growth potential. Consequently, birth weight and growth need to be carefully balanced. Fortunately, animals can be found that have both moderate Birth Weight EBVs and above average EBVs for later growth.

200 Day Milk: 200 Day Milk EBVs are estimates an animal's maternal effect on the 200 day weight of its calf. In the case of sires, this estimates the maternal effect that his daughters will have on the 200 day weight of their progeny. Larger, more positive, 200 Day Milk EBVs are generally more favourable, depending on the environment.

Growth: In general, with all other things being equal, higher growth rates will lead to higher profitability. In most economic analyses conducted positive emphasis on growth is warranted. BREEDPLAN calculates three growth EBVs – 200 Day Growth, 400 Day Weight & 600 Day Weight. These EBVs are the best prediction of the animal's ability to grow to weaning (200 day), yearling (400 day) and later ages (600 day). 200 Day Growth EBVs are therefore important to vealer breeders, 400 Day Weight EBVs for yearling breeders and 600 Day Weight EBVs for breeders of heavy steers.

200 Day Growth: EBVs are estimates of the genetic differences between animals in live weight at 200 days of age due to their genetics for growth. Calculated from the weights of calves taken between 80 and 300 days of age.

400 Day Weight: 400 Day Weight EBVs are estimates of the genetic differences between animals in live weight at 400 days of age. Calculated from the weights of calves taken between 301 and 500 days of age.

600 Day Weight: 600 Day Weight EBVs are estimates of the genetic differences between animals in live weight at 600 days of age. Calculated from the weights of calves taken between 501 and 900 days of age.

Mature Cow Weight: Mature Cow Weight EBVs are estimates of the genetic differences between cows in live weight at 5 years of age. Mature Cow Weight EBVs are expressed in kilograms (kg) and are calculated from weights taken on the cow when her calf's 200 day (weaning) weight is being measured.

Scrotal Size: Scrotal Size EBVs are estimates of the genetic differences between animals in scrotal circumference at 400 days of age. Increased scrotal circumference is associated with increased semen production in bulls, and earlier age at puberty of bull and heifer progeny. Increased scrotal circumference also has a favourable relationship with days to calving, such that bulls with larger scrotal circumference tend to have daughters with shorter days to calving.

Days to Calving: Days to Calving EBVs are estimates of genetic differences between animals in time from the start of the joining period (i.e. when the female is introduced to a bull) until subsequent calving. Lower, or more negative, Days to Calving EBVs are generally more favourable.

Carcase Weight: Carcass Weight EBVs are estimates of the genetic differences between animals in hot standard carcass weight (as defined by AUSMEAT) at 650 days of age. Larger, more positive, Carcass Weight EBVs are generally more favourable.

Eye Muscle Area (EMA): Eye Muscle Area EBVs are estimates of the genetic differences between animals in eye muscle area at 12/13th rib site in a standard weight steer carcass. Larger, more positive, EMA EBVs are generally more favourable.

Rib Fat: Rib Fat EBVs are estimates of the genetic differences between animals in fat depth at the 12/13th rib site in a standard weight steer carcass. More positive or more negative Rib Fat EBVs may be more favourable, depending on your breeding goals relating to the finishing ability of your animals. A bull with a Rib Fat EBV of -0.4 mm would be expected to produce leaner calves than a bull with a Rib Fat EBV of +0.4 mm, relative to carcass weight.

Rump Fat: Rump Fat EBVs are estimates of the genetic differences between animals in fat depth at the P8 rump site in a standard weight steer carcass. Stock with positive fat EBVs are likely to produce progeny that are fatter, or more earlier maturing, on average than stock with lower or negative fat EBVs. Increasing fat depth leads to a decrease in retail beef yield, however most market specifications require a minimum fat depth. Breeders aiming to breed leaner, higher yielding cattle may select for lower fat EBVs. Breeders wishing to finish their animals earlier may tend to select animals with moderate fat EBVs.

Retail Beef Yield (RBY): Retail Beef Yield (RBY) EBVs are estimates of genetic differences between animals in boned out retail beef yield in a standard weight steer carcass. Larger, more positive, RBY EBVs are generally more favourable.

Intramuscular Fat (IMF): Intramuscular Fat (IMF) EBVs are estimates of genetic differences between animals in intramuscular fat (marbling) at the 12/13 rib site in a standard weight steer carcass. Larger, more positive, IMF EBVs are generally more favourable.

Vealer Terminal Index (\$) – Estimates the genetic differences between animals in net profitability per cow joined for an example crossbred commercial herd (ie. using Murray Grey bulls over British bred females) targeting vealer production. Vealers are finished on grass and marketed at 365 kg live weight (average 200 kg HSCW and 9 mm P8 fat depth) at 10 months of age. Daughters are NOT retained for breeding and so no consideration is given to maternal traits (ie calving ease daughters, female fertility, mature cow weight).

Supermarket Index (\$) - Estimates the genetic differences between animals in net profitability per cow joined for an example Murray Grey commercial herd targeting production of steers for the domestic supermarket trade. Steers are either finished on grass, or grain fed for 70 days, and marketed at 470 kg live weight (average 260kg HSCW and 12mm fat) at 15 months of age. Daughters are retained for breeding.

Heavy Grass Fed Steer Index (\$) - Estimates the genetic differences between animals in net profitability per cow joined for an example Murray Grey commercial herd targeting pasture finished steers for heavier grass fed markets. Steers are assumed marketed at 620 kg live weight (340 kg HSCW and 14 mm P8 fat depth) at 24 months of age. Daughters are retained for breeding.
