Inspection Day – Monday 11th Oct 10am – 2pm

FIRGROVE POLL

Situated 25km east of Hamilton, the Firgrove operation is first and foremost a commercial enterprise.

We aim to breed a balanced merino where muscle and fat provide the engine to support a productive, stylish white fleece on a fast growing, early maturing deep body.

Our genetics target and capture the markets of lamb, mutton, surplus sheep (through fertility) and wool.

Resilience is bred into our sheep through carcass traits along with worm resistance to get them through

the tougher periods and aid in lamb and weaner survival.

Scoring breech wrinkle, breech cover and dag has allowed us to move to a non-breech modification.

We use ASBV's along with rigid visual classing and a full pedigree to select animals fitting these criteria.

The Firgrove adult clip averages 18.5 micron and runs under a winter stocking rate of 16DSE/ha. An animals ability to survive and thrive under these conditions is vital.

ASBVs

GROWTH TRAITS

- PWT** Post Weaning Weight
- YWT** Yearling Weight

The higher these numbers the quicker your weaners will grow. Crucial for turning wether lambs off and optimizing maiden conception

CARCASS TRAITS

- YEMD** Yearling Eye Muscle Depth
- YFAT** Yearling Fat Depth

These are the doing ability indicators for your weaners and the engine room for your ewes. Our objective is to have a ratio of 2 EMD to 1 FAT

Increasing **EMD** will shift lean meat yield from the low value forequarter to the higher value loin plus improving dressing percentage. Higher EMD will increase lamb conception, plus other benefits of CV improvement, worm resistance and capping adult body weight.

Increasing **FAT** will round up your sale wethers. Fat becomes particularly important with your ewe flock under tough conditions the benefit you will see will be increased lamb survival – 1mm fat equates to 5% increase in lamb survival. Also they will be better able to cope with restricted nutrition over summer meaning less live weight loss.

WOOL TRAITS

- YCFW** Yearling Clean Fleece Weight
- YSL** Yearling Staple Length
- YFD** Yearling Fibre Diameter
- YDCV** Yearling Coefficient Variation of Fibre Diameter

The higher **YCFW**, the more wool the progeny will cut.

The higher **SL**, the longer the progeny's staple will be. SL indicates how fleece weight is achieved (through increased skin or staple length).

The lower **FD**, the lower the progeny's micron will be. 0 is around 19mic

Lowering **DCV** will reduce the likelihood of fleece rot and body strike in the progeny.

ASBVs

WELFARE TRAITS

- YWEC** Yearling Worm Egg Count
- EBWR** Early Breech Wrinkle
- EBCOV** Early Breech Cover

Rams with more negative **WEC** produce progeny who have a higher genetic potential to resist worm burdens.

Selecting sheep with a lower

EBWR score have a lower susceptibility to fly strike. Where breech modification has ceased, sheep with lower breech wrinkles are much easier to manage

EBCOV is measured by how much bare skin is around the anus. It is one of the indicator traits for susceptibility to fly strike.

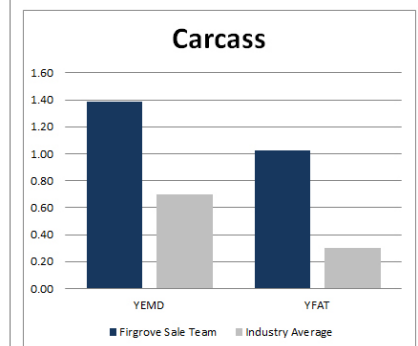

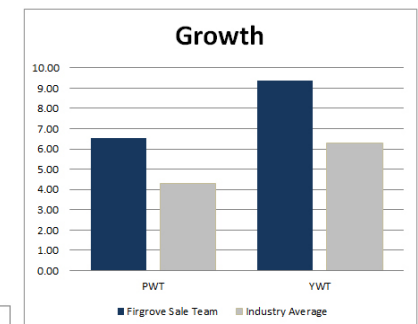

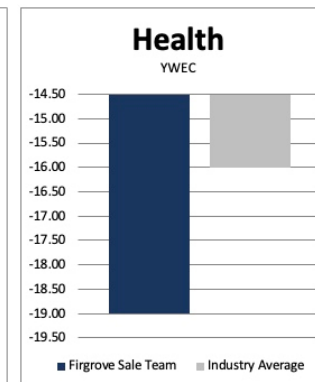

Combining low EBWR and EBCOV can significantly reduce fly strike and reduce the reliance on a breech modification.

Higher reproduction is a great free lunch for plainer bodies and barer breeches.

REPRODUCTION

- NLW** Number of Lambs Weaned

Rams with more positive **NLW** will sire daughters that will wean a higher percentage of lambs

CLASSING

We work with Dr Mark Ferguson and Darren Gordon (0408 114 656) at neXtgen Agri who are helping us through the use of ASBV's (Australian Sheep Breeding Values). Breeding a well-balanced animal between growth, carcass and wool. This is done alongside rigid visual assessment for structural soundness and looking for an animal with a deep barrel and square back end with width and depth through the twist. Andrew Howells (0418 846 291) has stepped in to take the lead in the visual classing.
