

NARRALDA SHORTHORN STUD

2021 BULL & FEMALE SALE

WEDNESDAY FEBRUARY 24 at 1pm

Great Southern Regional Sale Yards, Mt Barker, WA.

CONTACT: Graeme Burrow,
50129 South Coast Hwy,
Albany, WA.

Mobile: 0428 452 335

Email: narralda@activ8.net.au

 AuctionsPlus™

WHAT IS THE DIFFERENCE BETWEEN AN EPD AND AN EBV?

An EBV (Estimated Breeding Value) is defined as an estimate of the animals own genetic value for a particular trait.

An EPD (Expected Progeny Differences) is defined as the genetic merit of an animals progeny. As the parent contributes on average 50% of its genes to its progeny, an EPD is theoretically half an EBV (ie; $0.5 * EBV = EPD$). However, whilst this is theoretically true, a number of other factors means that this is not a great way to make comparisons between EPD's and EBV's. Also, EPD's have traditionally been analysed in a single trait evaluation model, whilst EBV's have been calculated in a multi-trait evaluation model. Now, with the application of the BOLT software, IGS has moved to a multi-trait evaluation model for carcass traits.

UNDERSTANDING IGS EPD'S

MATERNAL EPDS

CALVING EASE DIRECT (CE-D)

Reported as the percentage of extra unassisted births in first calving heifers, relative to the average.

CE-D is relative to the direct Calving Ease of the animal.

Higher values are more favourable.

CALVING EASE MATERNAL (CE-M)

Reported as the percentage of extra unassisted births in first calving heifers, relative to the average. CE-M is relative to the Calving Ease of the daughters of the animal.

Higher values are more favourable.

MILK

Reported as pounds of weaning weight of progeny from the animals daughters, relative to the average.

Predicts the difference in maternal production of daughters relative to milk production and mothering.

Values are relative to the environment of the production system. Low input environments should be very conscious of introducing too much milk due to the increased nutrient requirements that it can place on cows.

MATERNAL WEANING WEIGHT

Reported as pounds of weaning weight of progeny from the animals daughters, relative to the average.

This is a measure of weaning weight differences relative to the combined effects of growth and milk.

Breeders who are not looking to change milk production should consider Total Maternal as the most relevant EPD for maternal weaning weights.

Higher values are more favourable.

STAYABILITY (STAY)

Reported as the differences in percentage of a sire's offspring that are predicted to still be in the herd at 6 years

of age... given that they calved at 2, relative to the average. Stayability is a measure of reproductive longevity.

Higher values are more favourable.

DOCILITY

Reported as the percentage of progeny, relative to the average, that will record a score of docile.

Higher values are more favourable.

GROWTH EPD'S

BIRTH WEIGHT

Reported in pounds of birth weight relative to the average.

When selecting bulls to use on heifers, breeders should also focus on the Calving Ease EPD as Birthweight is already used in the Calving Ease EPD calculation.

WEANING WEIGHT – ADJUSTED TO 205 DAYS

Reported in pounds of weaning weight of direct progeny, relative to the average.

Higher values are usually more favourable dependant on its relationship with birthweight.

YEARLING WEIGHT – ADJUSTED TO 365 DAYS

Reported in pounds of yearling weight of direct progeny, relative to the average.

Higher values are usually more favourable dependant on its relationship with birthweight.

CARCASE EPD'S – ADJUSTED TO 475 DAYS OF AGE.

CARCASE WEIGHT

Reported as pounds of Carcase Weight relative to the average.

Higher values are usually more favourable, however this is relevant to each producers target market.

RIB EYE AREA

Reported as square inches relative to the average.

Higher values are usually more favourable.

FAT

Reported as inches of back fat relative to the average.

Higher values are usually more favourable, however this requires a balance between adequate doing ability in daughters and carcase fat thresholds for target markets.

YIELD GRADE

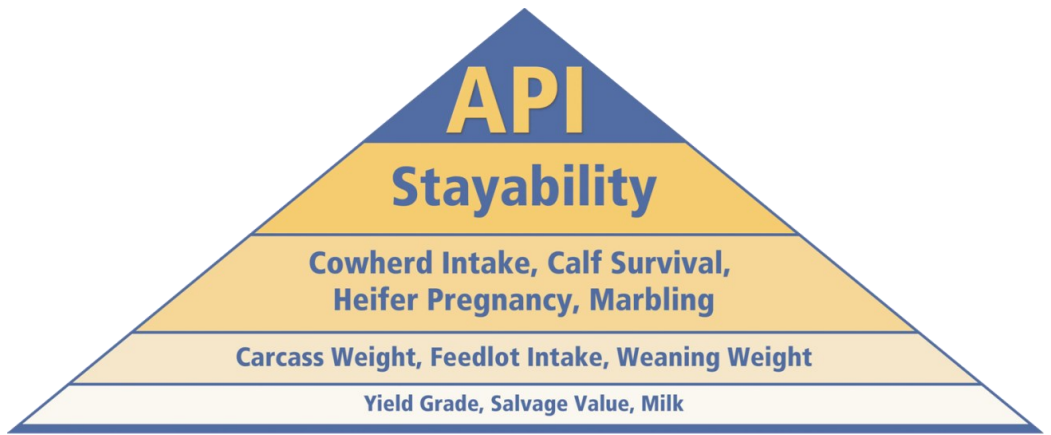

Reported as expected differences in progeny average USDA Yield Grade scores.

Yield Grade is used to improve the yield potential of progeny and may seem a strange value for Australian animals. Whilst Australian animals will never receive a USDA graded Yield Grade score, they will also never receive an actual Retail Beef Yield % value either. However, US Shorthorns (including progeny of Australian sires used in the US) are USDA graded each year and so the pedigree linkages provide linkage to actual USDA Yield Grade values.

Lower values are usually more favourable, however because of the negative correlations between fat and yield it is important to maintain some balance in the selection.

MARBLE SCORE

Reported as the differences in actual carcase marbling scores relative to the average. This is different to IMF% which is used as an indicator trait in Marble Score. **Higher values are more favourable.**

ALL PURPOSE \$INDEX – API

Though EPDs allow for the comparison of genetic levels for many economically important traits, they only provide a piece of the economic puzzle. That's where \$ Indexes come in. Through well conceived, rigorous mathematical computation, \$ Indexes blend EPD's and economics to estimate an animal's overall impact on your bottom line.

The All Purpose \$Index (API) evaluates sires for use on the entire cow herd, bred to both first-calf heifers and mature cows, with the portion of their daughters required to maintain herd size retained and the remaining heifers and steers put onto feed and marketed for both quality grade and yield.

UNDERSTANDING ACCURACIES

BOLT EPD accuracies have experienced the most change, usually lowering numerically and especially for non-parent animals, however the reported accuracy will be more accurate. Accuracy refers to the amount a reported EPD can possibly change as more data is added. EPD values with higher accuracy result in less possible change for the value over time. More accurate accuracies better represent the amount of possible change for each EPD.

CYDECTIN[®] LONG ACTING

INJECTION FOR CATTLE

There's nothing like it.

- ✓ The longest protection available against a range of internal and external parasites, thereby optimising the health and productivity of your cattle.
- ✓ The trusted power of moxidectin, in a unique low volume formulation (1 mL / 100 kg).
- ✓ Ideal for protecting young livestock (100–500 kg liveweight).
- ✓ Ideal for use in strategic tick control programs to prevent the build-up of tick populations and pasture contamination.
- ✓ No known impact on dung beetles, which can help to improve pasture production and reduce parasite burdens.
- ✓ Peace of mind that your cattle have the best protection against parasites.

THE LONGEST LASTING PROTECTION:

120 days protection
against Barber's Pole Worm

112 days protection
against *Ostertagia* (Small brown stomach worm)

51 days prevention
of development of viable cattle ticks

Shaping the future
of animal health

Virbac

**Thankyou for your bidding and attendance at the 2021
Narralda Shorthorn stud annual bull and female sale.**

**We wish you all the best with your purchases and for the
rest of the season.**
