## WHITE SUFFOLK STUD HISTORY

Founded in 1981, we continually aim to improve performance and productivity on sound structured sheep, and so provide high quality flock rams to prime lamb producers, and sound breeding stock to stud breeders.

Balanced breeding strategies have been set in place to achieve these goals. Advanced technology has been utilized - Artificial Insemination to introduce useful genetics and Lambplan for performance assessment.

We maintain a small but very influential appendix breeding sector within the stud. We consider maintaining accurate and detailed records alongside sound management practices essential.

Participation in health and quality assurance programs such as Ovine Brucellosis Accreditation and Ovine Johnes Disease, Market Assurance Program and DNA testing have been keenly sought.

To help speed our genetic progress, generation turnover is enhanced by using the best DNA analyzed ram lambs (7 months old) each year and lambing down our ewes from as young as 12 months.

Various embryo transfer programs have also been undertaken to make best use of our top ewes. High lambing percentages are also encouraged in the stud and in the last few years we have realized above 160% live lambs.

Our progress is measured by - Lambplan through across-flock SBVs, the results of trial work conducted both within flock and participation in public ones, client feedback and the performance of our stock within other studs.

To see our sires featuring at the top end of Lambplan rankings and the outstanding show, sale and production results by our clients gives us great confidence to continue our direction diligently.

# TOTAL CARCASE PRODUCTION (TCP)

Indexes generally help producers select animals for use within a breeding program when there are a range of traits of economic or functional importance. This ensures that genetic gain in one trait is not made in isolation from other traits. Using indexes in ram purchasing decisions allow producers to make balanced genetic progress towards more profitable sheep.

The TCP index has been created to assist producers to achieve both gains in their major production traits, such as post-weaning weight, muscling fat levels and lambing ease, as well as ensuring consumer satisfaction from lamb is maintained through focusing on key eating quality traits such as shear force (tenderness) and intramuscular fat (marbling).

**A basic indication is this TCP scale.**

BAND %	90	80	70	60	50	40	30	20	10	5	1
TCP	124	129	133	136	139 (av)	141	144	147	151	154	159

The performance information presented in this catalogue is based on the 30th September 2022 analysis.

We strongly encourage the integration of specific ASBVs to target market objectives, together with structural assessment and overall visual appraisal.

For more detail on any Detpa Grove animals, enter search site at address; <https://search.sheepgenetics.org.au/search/dashboard>, select buyer, select Terminal-All, select individual animals. Submit our stud name/flock code 230043 and click Detpa Grove option then enter the Animal ID in 6 digits (eg.210123).

There have been some enhancements of all ASBVs and Indexes provided by Lambplan. To re-calibrate your selection criteria please study the latest percentile bands at <https://search.sheepgenetics.org.au/report/percentile-bands?flockCode=&db=2&traits=1>.

# THANK YOU

A sincere thank you to all buyers and underbidders for your support today.

We wish you every success with your purchases and look forward to hearing of your future achievements.

Further, we wish to thank all those who helped in the lead-up and during the sale; your ongoing assistance is very much appreciated.

Sincerely,

*The Pipkorn Families*
