SuperBorder\$

SuperBorders is the brand name for Border Leicester rams that are of high genetic merit for a first cross production system. This year's SuperBorder cut off BLX figure is 115.67. These rams will have a yellow SuperBorder button at the back of their Lot number tag.

The BLX Index is a Border Leicester crossing Index, developed by Lambplan to better reflect the preferred traits for a first cross lamb production system, balancing mature size with significant improvements in early growth and reproduction.

Not all rams sold by SuperBorder members qualify as SuperBorders, but are bred by committed, registered breeders striving for genetic gain. SuperBorder rams must be structurally sound and of good breed type.

First cross lambs sired by SuperBorder rams may be sold as 'Bred from SuperBorders'. Special yellow pen cards are available to identify these lambs in physical sales and virtual cards for online sales.

Sheep Genetics have released a new trait called Weaning Rate, which replaces number of lambs weaned NLW. WR or Weaning rate encompasses the overall reproductive performance of the ewe, in conception, litter size and ewe rearing ability. This new Weaning Rate gives a picture of the genetic difference between female progeny of each particular sire, for the number of lambs alive at weaning.

Because of the inclusion of the new weaning rate WR, and deletion of the NLW figure, in the new BLX index, and other major updates within the analysis, there has been a big change in the Breeding values for some sires, this year. It is necessary to re-benchmark sires and adjust values within flocks, because some sires have been affected more than others by the new calculation for the updated BLX index.

Understanding the ASBV traits in the catalogue:

BWT: Birthweight is the genetic variation in birthweight of each sire's progeny.(Kg)

MWWT: Maternal weaning weight is the ability of each sire's female progeny to rear healthy live lambs.(Kg)

PWT: Post weaning Weight is the genetic variation in liveweight at 9 months of each sire's progeny(Kg)

PFAT: Post Weaning Fat Depth at 9 months for each sire's progeny(mm)

PEMD: Post weaning eye muscle depth variation in eye muscle depth per sire's progeny.(mm)

WR: Weaning Rate estimates the genetic variation between female progeny of a sire, for the number of lambs per ewe, alive at weaning.

BLX Index estimates the value of each animal for first cross ewe and wether production.

Acc: reflects the amount and quality of information used to calculate ASBVs.

Data Quality Score

Data is the cornerstone of Sheep Genetics' evaluations. DQS describes the overall quality of a flocks' data. Optimal data quality is vital in enhancing the reliability of ASBVs to make accurate selection decisions and therefore maximise genetic gain. It consists of data quantity, quality and timeliness. Jackson Farming is pleased to report a data Quality score of 5 stars, which enables clients to have confidence in the information provided.

Percentile report for Maternal 1st cross sire breeds (Border Leicesters) dated 15/08/2022 for 2021 drop animals.
