Danny Rapmund – 0458 637 070

www.francoherefords.com.au

Welcome to our 2022 Annual Sale being the 26th Sale at Avoca Vale.

An amazing 12 months has passed. Great season, great prices, coupled with covid and floods. We are still very fortunate to live in our wonderful country notwithstanding challenges which occur.

This year saw the ceasing of our chicken operations, converting the sheds into undercover yards, a feed mill and storage space for vehicles, implements, hay etc. It is exciting to start a new venture. Further I have resigned from the legal practice allowing more time for agricultural pursuits.

We are proud of this years bulls. The sires of the bulls are sons of Knockout, Black Hawk and some of his sons, Explosive and National Hero over females which include Vice Regal and Haymaker matrons.

Explosive dominates the numbers this year producing excellent fat cover, intramuscular fat and good E.M.A. Of course, our Black Hawk sons are very good as well.

We only have 3 bulls which resented being on their own in a pen, but settled quickly once with their mates. The rest of the draft are very quiet on their own.

We know our clients look for quiet bulls and we attempt to oblige.

Bulls have received the following treatments:

12/10/20 - Flukare C + Selenium, first 3-day sickness vaccine
15/11/20 - Second 3-day sickness vaccine
9/12/20 - Dectomax P/On
5/4/22 - 7 in 1, Pestigard, Vibrovax, Dectomax P/On, Flukare C + Selenium, Marks Min Trace Minerals with Vitamin B12

This year saw the death of three of the best Northern Rivers Hereford supporters.

Terry McMahan died on the 5th April 2022. Terry had been to nearly all our sales. A great bloke.

Draxy Peterson died on the 1st October 2021. Jim and Draxy were always at our Hereford functions and Draxy shall be greatly missed.

Coral Reid died on the 9th April this year. Malcolm and Coral, like Jim and Draxy were loyal and popular members of our local Hereford Group. Coral was an extraordinary lady who set a great example for all of us to follow.

We offer all three families our sympathy and understand their grief, but we know their 3 dearly departed will look after us from above.

This year also saw Ruth Attewell leave Franco in December. Ruth had been a very long-term work mate for approximately 23 years. We wish her well in her retirement.

Mick Carter also left us during the year. His knowledge of our cattle will be missed. Likewise, we wish Mick all the best as he scales his work load down.

This year has also seen Glen Keep and Jamie (Benno) Bennett take a more hands on approach with our cattle and we welcome Danny Rapmund and Stacey Clark to the fold.

We wish you well with your purchases and please remember we guarantee our bulls for fertility for 12 months and structurally for 3 months.

Thank you to Brett, Ruth, Mick, Glen, Jason, Benno, Glenn, Stacey and Danny. Thank you to our loyal helpers Aaron, Renee, Mary, Helen, Sharee, Edwin, Rino, John, Selma, Mick, Pauline and sons and to our Agents George & Fuhrmann and Ramsey & Bulmer.

Frank Hannigan

For the Franco Herefords Team.

HEREFORD EBVs.

EBVs

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These estimates are called Estimated Breeding Values (EBVs).

In the calculation of EBVs, the performance of individual animals within a contemporary group is directly compared to the average of other animals in that group. A contemporary group consists of animals of the same sex and age class within a herd, run under the same management conditions and treated equally. Indirect comparisons are made between animals reared in different contemporary groups, through the use of pedigree links between the groups.

EBVs are expressed in the units of measurement for each particular trait. They are shown as +ve or -ve differences between an individual animal's genetics difference and the genetic base to which the animal is compared. For example, a bull with an EBV of +50 kg for 600-Day WWeight is estimated to have genetic merit 50 kg above the breed base of 0 kg. Since the breed base is set to an historical benchmark, the average EBVs of animals in each year drop has changed over time as a result of genetic progress within the breed.

The absolute value of any EBV is not critical, but rather the differences in EBVs between animals. Particular animals should be viewed as being "above or below breed average" for a particular trait. Whilst EBVs provide the best basis for the comparison of the genetic merit of animals reared in different environments and management conditions, they can only be used to compare animals analysed within the same analysis. Consequently, Hereford BREEDPLAN EBVs cannot be validly compared with EBVs for any other breed.

Although EBVs provide an estimate of an animal's genetic merit for a range of production traits, they do not provide information for all of the traits that must be considered during selection of functional animals. In all situations, EBVs should be used in conjunction with visual assessment for other traits of importance (such as structural soundness, temperament, fertility etc). A recommended practice is to firstly select breeding stock based on EBVs and to then select from this group to ensure that the final selections are otherwise acceptable.

EBVs are published for a range of traits covering fertility, calving ease, milking ability, growth, carcass merit and feed efficiency. When using EBVs to assist in selection decisions it is important to achieve a balance between the different groups of traits and to place emphasis on those traits that are important to the particular herd, markets and environment. One of the advantages of having a comprehensive range of EBVs is that it is possible to avoid extremes in particular traits and select for animals with balanced overall performance. **Calving Ease EBVs (%)** are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

CE % Direct = Direct Calving Ease - The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

CE % Daughters = Daughters' Calving Ease - The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age. **Gestation Length EBV (days)** is an estimate of the time from conception to the birth of the calf and is based on AI and hand mating records. Lower (negative) GL EBVs indicate shorter gestation length and therefore easier calving and increased growth after birth

Birth Weight EBV (kg) is based on the measured birth weight of progeny, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers

200-Day Growth EBV (kg) is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age

Mature Cow Weight EBV (kg) is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weight at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. Steer breeders wishing to grow animals out to a larger weight may also use the Mature Cow Weight EBV.

Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of the daughter's milking ability, inherited from the sire, on the 200-day weights of her calves. For dams, it indicates her milking ability.

Scrotal Size EBV (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

Days to Calving EBV (days) indicates the fertility of the daughters of the sire. It is the time interval between when the female is first exposed to a bull in a paddock mating to the day when she subsequently calves. A negative EBV for days to calving indicates a shorter interval from bull-in date to calving and therefore higher fertility.

Carcass Weight EBV (kg) is based on abattoir carcass records and is an indicator of the genetic differences in carcass weight at the standard age of 650 days.

Eye Muscle Area EBV (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcass data, adjusted to a standard 300 kg carcass. This EBV estimates genetic differences in eye muscle area at the 12/13th rib site of a 300 kg dressed carcass. More positive EBVs indicate better muscling on animals. Sires with relatively higher EMA EBVs are expected to produce better-muscled and higher percentage yielding progeny at the same carcass weight than will sires with lower EMA EBVs.

Rib Fat and Rump Fat EBVs (mm) are calculated from measurements of subcutaneous fat depth at the 12/13-rib site and the P8 rump site (from live animal ultrasound scans and from abattoir carcasses) and are adjusted to a standard 300 kg carcass. These EBVs are indicators of the genetic differences in fat distribution on a standard 300 kg carcass. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcass weight than will sires with higher EBVs.

Retail Beef Yield EBV (%) indicates genetic differences between animals for retail yield percentage in a standard 300 kg carcass. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

Intramuscular Fat EBV (%) is an estimate of the genetic difference in the percentage of intramuscular fat at the 12/13th rib site in a 300 kg carcass. Depending on market targets, larger more positive values are generally more favourable.

Dockility EBV (%) is calculated from dockility scores taken at weaning or shortly afterwards. This EBV is an estimate of the genetic difference in the percentage of progeny that will be scored as docile or restless (scores 1 or 2).

Net Feed Intake (Feedlot Finishing) EBV (kg) is an estimate of genetic differences between animals in feed intake at a standard weight and rate of weight gain when animals are in a feedlot finishing phase. NFI-F EBVs as expressed as kilograms (kg) of feed intake per day. Lower, or more negative, NFI-F EBVs are more favourable. For example, a bull with an NFI-F EBV of -0.6 kg/day would be expected to produce progeny that eat less feed per day than the progeny from a bull that has an NFI-F EBV of +0.8 kg/day (when the progeny are of similar weight, are growing at a similar rate, and are in a feedlot finishing phase).
