

CASTLE CAMPS

BORDER LEICESTER & WHITE SUFFOLK STUD

74 White Suffolk Rams 74

88 Border Leicester Rams 88

SALE DETAILS

Sale commences 11.00 am • Inspections from 9.30am

2018 Riddoch Hwy, Keith

To be eligible for transfer as a stud ram the minimum sale price is \$1500 (plus GST)

Accredited Brucellosis Free • OJD Vaccinated • Lambplan Tested • Morning tea and lunch provided

Terminal Carcass Production (TCP) index

Summary of the TCP index

- The TCP index targets improvement of terminal sire performance in prime lamb production systems.
- TCP balances increased lean meat yield with modest improvements in eating quality.
- Genotyping young rams makes TCP more effective by improving the accuracy of carcass and eating quality ASBVs.

Production system outline

This production system is for a prime lamb operation where terminal sires are joined to ewes of a Merino/ maternal breed or cross. The TCP index focuses on increasing weight and muscle while reducing carcass fat, which contribute to higher lean meat yield. TCP also has emphasis on modest improvements in eating quality.

Trait contribution

Figure 1 illustrates which traits are in the Index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

In the Terminal Carcass Production system, growth and improved carcass eye muscle contribute the most to the index, with smaller contributions from carcass fat depth, lean meat yield and dressing percentage. Improvements in intramuscular fat and shear force contribute to maintaining lamb eating quality.

Figure 1: The traits in the TCP index and how they contribute to the overall balance of the Index in the top 10% of current terminal progeny.

Eating Quality index (EQ)

Summary of the EQ index

Typical trait changes for the EQ index include:

- The EQ index targets improvement of terminal sire performance in prime lamb production systems.
- EQ balances large improvements in eating quality with modest increases in lean meat yield.
- Genotyping young rams makes EQ more effective by improving the accuracy of carcass and eating quality ASBVs.

Production system overview

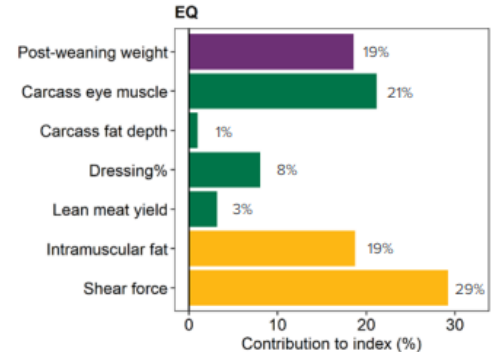

This production system is for a prime lamb operation where terminal sires are joined to ewes of a Merino/ maternal breed or cross, and where producers are interested in improving the eating quality of their lambs to a greater degree than is possible with the TCP Index.

Trait contribution

Figure 2 illustrates which traits are in the index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

The EQ Index has large contributions from increasing body weight and carcass eye muscle, with smaller but still favourable impacts from reduced carcass fat depth with increases in dressing percentage and lean meat yield. Large improvements in intramuscular fat and shear force contribute to improved lamb eating quality.

Figure 2: The traits in the EQ index and how they contribute to the overall balance of the index in the top 10% of current terminal progeny.

Border Leicester Cross (BLX)

The BLX index is for a first cross operation where maternal sires are joined to Merino dams, with the first cross female offspring then used in prime lamb systems joined to terminal sire rams. The index favours high early growth animals with good reproduction.

Typical trait changes with the BLX index include:

- maintaining fleece weight
- increasing growth
- increasing adult weight
- increasing maternal weaning weight
- improving carcase traits
- increasing number of lambs weaned

Figure 1 illustrates which traits are in the BLX index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

BLX aims to maintain adult weight at current levels because bigger ewes have higher feed and animal handling costs. However, this is difficult to achieve in practice because bigger ewes also produce more

lambs, which reach sale weight faster, so the index makes a trade-off to achieve an optimal balance across all traits.

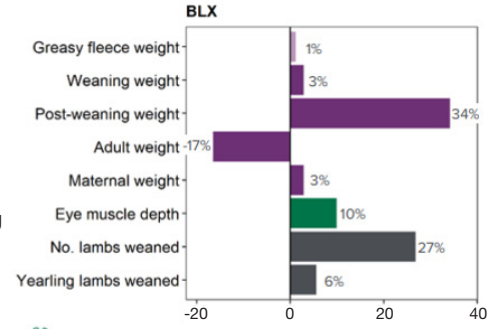

Figure 1 shows that increasing adult weight has a negative contribution on the index. However, individual ram breeders who measure early growth, adult weight and reproduction will have greater control over this balance.

Weaning Rate (WR)

Sheep Genetics have introduced a new trait that measures reproductive performance called Weaning Rate. Weaning Rate replaces Number of Lambs Weaned (NLW). Weaning Rate measures the number of additional lambs weaned per ewe joined.

Weaning Rate combines the ewe performance in conception, litter size and ewe rearing ability. It has replaced NLW in the Index, and as a result of this and other major enhancements within the analysis, breeding values will have changed. It is important to rebenchmark sires using the most recent Percentile Reports.

Figure 1: The traits in the BLX index and how they contribute to the overall balance of the index

The BLX Index cannot and should not be compared to the Maternal \$ Index you might see in other publications.

Percentile Report

A black and white photograph of a large ram sitting in a field with two smaller lambs in front of it. The ram is on the left, looking towards the camera. The two lambs are on the right, also looking towards the camera. The background is a grassy field with some trees in the distance.

Thank you for attending the
annual Castle Camps ram sale.
Mum said we couldn't go this
year but we will be next year.
We are looking forward to
seeing you there.
