ALL WITH COMPREHENSIVE GROUP BREEDPLAN EBV'S EVALUATED UNDER
COMMERCIAL CONDITIONS FROM ACTUAL ON FARM MEASUREMENTS

ALL BULLS VACCINATED WITH 7-IN-1, PESTIGARD AND VIBRIOSIS VACCINES.
AREA FREE TB AND BRUCELLOSIS. HERD STATUS FOR JOHNES DISEASE J-BAS 6
EU ACCREDITED HERD

* FREE DELIVERY TO 400KM *

ELITE'S COMMERCIAL BREEDING DIRECTION

Commercial needs and profitability form the focus of the breeding program at Elite Poll Herefords.

The herd of 360 commercial and registered animals is run as a commercial herd under testing conditions and is selected for industry relevant traits emphasizing calving ease, good temperament, growth, milk, muscle and IMF. We supply the valuable MSA, EU and feedlot markets, hence our awareness of traits to emphasize in our selection program for success in these markets. This in turn assists clients selecting sires for their markets.

Our unique and most valuable resource is our large number of performance recorded commercial animals.

This enables us to relate feedback from processors, feedlots etc. to the EBV's of the animals we supplied. By using this information we improve real world commercial profitability for our herd and our clients. Our cattle deliver balanced true and sustainable commercial value. In the near future this feedback will be used to enhance the genomic profile of our herd and so accelerate our progress.

At the top of mind always is the production goal of producing a **vigorous calf that can grow to a valuable carcass.**

We are aware of the profit drivers needed for our business and that of our clients. We look at these profit drivers as "on farm" and "market".

"On farm" profit drivers include animal soundness, (which is a must before any other selection), fertility, calving ease (CE), and good temperament. Selection for quieter temperament also assists in achieving higher meat quality plus safety for all in the production chain.

The "market" profit drivers include growth and profitable carcass attributes (including good muscling and yield, adequate fat cover and IMF) for the markets targeted. Our growth selection aims for top 400 day growth for earlier turn off, yet for more moderate later weights to contain breeder maintenance costs.

ELITE'S COMMERCIAL BREEDING DIRECTION

As our foremost consideration is the need for a healthy, live calf, we look to use sires with positive genetic calving ease both direct and maternal, and moderate birth weight. Plus, we breed only from females that have a problem free, regular, calving record.

We believe that selection for our females genetic ability to calve, (CE maternal), rather than just light birth weights, is vital. It creates a herd generation by generation, with the “built-in” ability to calve with minimal problems. It can also reduce the vulnerability, particularly of calving heifers, to seasonal nutritional fluctuations.

The sires that we use for our heifers are the sires we use for the whole herd. So, in addition to calving ease, they must have the growth and carcase attributes demanded by our modern markets.

SEMEN SIRE

Semen is available in our top performance sires such as Elite Trust K215 above. Semen rights in K215 recently sold to Ardo Herefords, New Zealand. See our other semen sires on the Elite Poll Herefords website.

CALVING EASE - NOT JUST FOR HEIFERS

As commercial breeders, **our income is heavily dependent on the number of calves produced and the weight of those calves when sold.**

This confirms that one of the most important fertility traits for breeding females is for them to calve unassisted and so ensure a higher number of vigorous live calves are produced.

Nationally, an MLA sponsored report identified dystocia (calving problems) as the 4th most costly disease in cattle! Cattle tick and buffalo fly were more costly, but as those diseases are mainly northern area diseases, **it leaves dystocia as the 2nd most costly disease of cattle in our temperate areas.**

Research has shown that using sires with low birth weight and/or high Calving Ease (CE) Direct have similar effects. They can improve CE in the individuals but CE of the progeny is reduced, as is their growth potential. However, selection for high CE Daughters improves CE of the individual and of the progeny and doesn't reduce the progeny growth potential. Selection for CE Daughters also reduces Gestation Length.

At Elite we put much emphasis on calving ease, but consider CE daughters particularly, to be the valuable trait to prioritize for any self-replacing straight-bred herd selection program. Whilst selection for improved carcass traits is extremely important for any commercial herd calving ease is more important initially.

By increasing the EBV value of this trait in the females we are increasing the **genetic ability** of them to calve unassisted and this improved ability is permanent and able to be passed on to their own offspring.

Using sires with high CE daughters EBV's over the entire herd, not just the heifers, is the quickest way to put this valuable trait into the herd, through their daughters. Sires used over the mature females therefore need to have good CE daughters as well as the growth and carcass traits necessary for the market supplied.

CALVING EASE - NOT JUST FOR HEIFERS

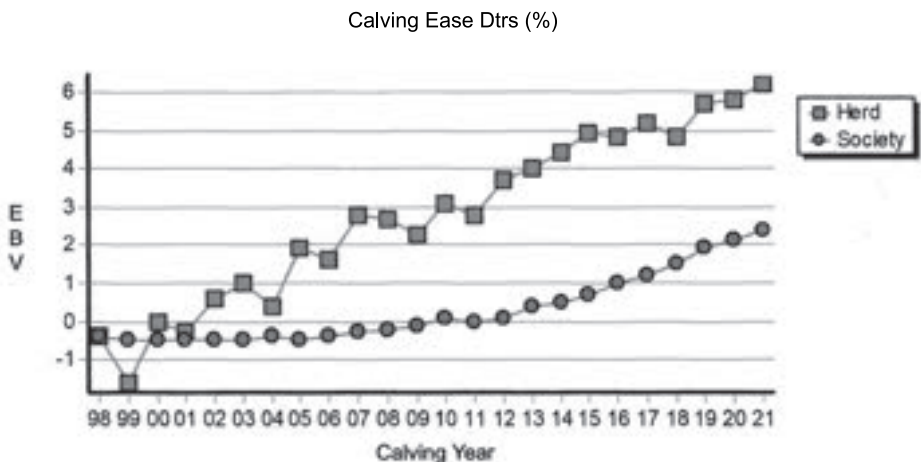

As a sire's daughters generally remain in the herd for at least 7 years, his genetic influence, through them, for CE and other traits, is quite long term. Hence the need to not delay in introducing this valuable trait.

The benefits of unassisted births are many and include supervision cost savings, veterinary services cost savings, less calf losses, better calf growth, improved animal welfare, more fertile dams for rejoining, and more peace of mind.

There many factors that can influence ability to calve, but to ignore the genetic component is to ignore a "free lunch" which definitely works!

As the influence of genetic CE daughters increases within a herd, it will override some of the negative environmental and management influences on CE.

Often it is said a high growth bull has "grunt", but, unfortunately, if he doesn't have CE as well it will be his heifers that have to "grunt"!

CALVING EASE - NOT JUST FOR HEIFERS

400 Day Weight (Kg)

Gestation Length (Days)

ELITE'S MARKET FOCUS

Inspecting premium Elite MSA carcasses

Selection to increase carcass muscling has enabled Elite steers and heifers to take advantage of higher priced grids, like the MSA and the better EU grids. These grids require a C shape butt and acceptable meat colour. Adequate muscling must underlay the premium fat requirement to attain the C butt. Our animals' quiet temperament plus good trucking management is necessary to preserve meat colour on long trucking journeys.

Successful conformance of heifers to the higher priced grids is a real bonus for us.

Saleyard buyers also pay a premium for better muscled cattle (NLRs analysis) with the correct fat cover. These premiums are virtually impossible to enjoy unless the whole herd muscling is raised to well above breed average.

An increase in muscling also increases dressing percentage of carcasses, and assists achieve a more even carcass fat cover. **A further bonus of the better muscled cattle from Elite is that carcass weights are higher relative to 600 day weights, thus reducing the maintenance requirements of the herd, whilst maintaining or increasing slaughter weights.**

Other carcass attributes are not overlooked in the Elite selection program. **The recognition that higher IMF is necessary** to ensure enhanced eating quality for our product, and to take advantage of the longer fed feedlot markets, directs our selection. **Well muscled animals with above average IMF levels increase market options** for us and our clients.

For example, **markets requiring MSA compliant cattle** have given premium returns to Elite steers and heifers. Elite steers and heifers achieve top MSA grading which ensures a top eating quality product.

Our selection program, which includes achieving good IMF levels and superior weight for age, giving lower ossification scores, contribute to the MSA results.

NOTICE TO BUYERS

1. All bulls reared naturally on their dams on predominantly improved native pastures. All Group Breedplan figures generated under these conditions.
2. No bulls have been hoof trimmed.
3. All Bulls have passed independent evaluation for structural soundness, testicular tone, testicular circumference and semen quality including morphology.
4. **All registered animals are denoted as (REG) in this catalogue.** They will be transferred to the purchaser free of charge.
5. **HEALTH**
All bulls have been given initial **and booster** (7/6/2022) vaccination with UltraVac 7-in-1, Vibriosis and Pestigard vaccines. **Routine annual vaccinations are necessary to maintain immunity. These boosters can be given at the time you routinely vaccinate in your herd.** All bulls have been tested for Peste virus and found to be PI free. That is, no persistently infected animals were found.
6. **2 year Unconditional Guarantee**
Should your selection prove unsatisfactory to you within this period from purchase, we shall ensure you recover your purchase price (eg we pay you the difference between salvage value and purchase price) or we replace your bull, if a satisfactory replacement is available. This cannot, of course, cover death, disease, injury or misadventure for which a selection of insurance covers are available.
7. **FREE DELIVERY to 400km** cannot be given immediately, but will be organised within 14 days after sale.
8. Bulls will be held at "Eulalia" after sale until trucking free of charge but at purchaser's risk.

MANAGING YOUR NEW BULL

- ◆ Sale bulls from “Eulalia” have been handled quietly and with care all their lives. They are run in relatively large groups, ie not alone.
- ◆ When they arrive at their new home, they have to adjust to new yards, different noises, loss of their mates, different people, different handling methods, trucking, unloading, new paddocks, different feed and water! That is, it is a stressful time for them.
- ◆ To minimise the stress and speed their settling to their new environment, it is helpful to unload them at the yards into a group of quiet house cows, herd cows or steers so they are again in a “herd” and not alone. Feed with hay and let them settle.
- ◆ This is even more important if they arrive at night. Provide hay and water if they arrive at night and leave handling until the next morning. Definitely don’t jump them off the truck into an open, strange paddock. Settling may be immediate or take some time.
- ◆ At his first joining, check your new bull regularly for at least the first 2 weeks, so any injury is detected early. Early detection and removal from the group may mean minimising any loss of use.
- ◆ Try to avoid joining a young bull in a group with an older bull or bulls, as he will be dominated and so do little work for you.

BREEDPLAN EXPLANATION

Breedplan is a performance evaluation program that describes the genetic profile of beef cattle for a number of commercially important traits. This profile is given as an Estimated Breeding Value (EBV), expressed as a figure (+/-) relative to the breed benchmark of zero (0) for each trait.

The EBVs in this catalogue are Current Group Breedplan EBVs and can be directly compared with Poll Herefords or Herefords from Australia or New Zealand that have Current Group Breedplan EBV's.

To evaluate the performance profile of a bull, its EBVs can be directly compared with the EBVs of other bulls, against the breed benchmark of zero (0), or against the current breed average EBV for each trait, which for the 2020 calving year was

BIRTH WT.	GENETIC MILK	200 DAY WT.	400 DAY WT.	600 DAY WT.	P8 FAT DEPTH	EMA	CARC WT.	RBV %	IMF %
+4.0	+17.0	+33.0	+55.0	+78.0	+0.8	+3.8	+51.0	+0.8	+0.6

EBVs are provided for the following traits...

Birth Weight: The lower the birth weight EBV, the lighter is the birth weight potential of a sire or dam's progeny. Often low birth weight EBV's are associated with low growth EBV's, so aim for a good balance between the birth weight and growth EBV's to avoid unnecessary production penalties.

Calving Ease Direct

Calving Ease (DIR) EBVs are estimates of genetic differences in the ability of a sires' calves to be born unassisted from 2 year old heifers. The EBVs are reported as differences in the percentage of unassisted calvings. Higher, more positive, Calving Ease (DIR) EBVs are more favourable. For example, a bull with an EBV of +5.0% would be expected, on average, to produce 3% fewer difficult calvings from 2 year old heifers than a bull with an EBV of -1.0% (6% difference between the Sires, then halved as they only contribute half the genetics).

Calving Ease Daughters

Calving Ease (DTRS) EBVs are estimates of genetic differences in the ability of a sire's 2 year old daughters to calve without assistance. The EBVs are also reported as differences in the percentage of unassisted calvings. Higher, more positive, Calving Ease (DTRS) EBVs are more favourable. For example, a bull with an EBV of +4.0% would be expected to on average produce 2 year old daughters that have 3% less calving problems than the daughters of a bull with an EBV of -2.0%.

BREEDPLAN EXPLANATION

Genetic Milk: Reflects the extra calf weight from the genetic contribution to the dam's milk production. Genetic milk EBV for a cow is the best prediction of her milk producing ability; for a sire it is for his daughter's milk producing ability. The level of milk aimed for depends on the markets targeted and the environment in which the herd is run.

200 Day Weight: Indicates the relative genetic weight difference potential at 8-10 months of age.

400 Day Weight: Indicates the relative genetic advantage of a sire's progeny at yearling age. This EBV is important for selecting sires to breed progeny for the domestic markets (eg heavy retail or restaurant markets.)

600 Day Weight: Indicates the relative genetic weight difference potential beyond yearling age. This EBV is important in selecting sires to breed steers for heavier grass and grainfed export markets.

Fat Depth: Fat Depth EBV's are estimates of the genetic differences between animals in fat depth at either the 12th/13th rib or P8 rump site in a 300kg carcass. Bulls with negative (-) EBVs for this trait are expected to produce relatively leaner progeny than bulls with positive (+) EBVs at any given carcass weight. Whilst lower fat may give increased Yield%, neutral or slightly positive fat is advantageous for most natural pasture production systems.

EMA: EMA EBV's are estimates of the genetic differences between animals in eye muscle area at the 12th/13th rib site in a 300kg carcass. Bulls with higher EBV's for this trait are expected to produce progeny with a relatively larger (more favourable) eye muscle area than progeny of bulls with a lower EBV. Where positive fat is needed (eg pasture system), then higher EMA EBV's will maintain and/or increase Yield % at any particular carcass weight. Higher EMA's also assist better carcass fat distribution for better chiller results.

Carcass weight (kg): Based on abattoir carcass records and is an indicator of the genetic differences in untrimmed hot carcass weight at the standard age of 650 days.

Retail Beef Yield % (RBY%): Estimates the genetic differences between animals for percentage retail beef yield in a 300kg carcass with 2-3mm fat trim and adjusted to 85% chemical lean. Larger more positive Yield% values are more desirable.

Intra-Muscular Fat% (IMF%): Estimates the genetic differences in intra-muscular fat at 12/13th rib site in a 300kg carcass. IMF can enhance eating quality of beef and moderate amounts are sort after for short and medium fed feedlot cattle.

Accuracies: The accuracy provides a measure of the reliability of the EBV. The higher the value, the less likelihood of the EBV changing with the addition of more performance records on the animal.

\$INDEXES

The BreedObject \$Index is a tool designed to help breed more profitable cattle. The technology was developed by the Animal Genetics and Breeding Unit (AGBU), a joint institute of NSW Agriculture and the University of New England. There are potentially 18 EBV's now available to define the animals breeding value, so simplification into **a single \$Index, designed for specific markets, can be of great assistance.**

The Index indicates the possible extra dollars earned per cow joined in self replacing herds and is derived from all the EBV values available for an individual.

eg. A \$Index difference of \$20 between 2 potential sires, for the same breeding objective, would give the ability to earn an extra \$10 per cow joined, to the higher Indexing bull. If this bull was joined to total of 300 cows during his herd life, he could generate an additional \$3000 (\$10 x 300).

The Index is calculated by giving different 'weightings' to the EBV's depending on the market and the relative economic importance of the traits, when looking at the 20 yr profitability of a self replacing herd. Thus, a true balance to selection is facilitated.

The fact that several bulls may have the same \$Index for any given market does not necessarily mean that they will all suit your breeding objectives. That is, BreedObject can be used as a 'screening' device to select animals within the \$index range suitable to you. For example, 3 bulls may have an index of \$80, but have birth weight EBV's of 2.4, 4.5 and 6.2. If low birth weight is a priority for your herd, the bull with the EBV of 2.4 would be your choice if all his other EBV's were acceptable.

As with the EBV values, a benchmark of the average \$Index for all the bull calves born nationally in 2020 is given.

\$INDEX EXPLANATION

There are currently four different selection indexes calculated for Australian Hereford animals. These are:

- ◆ Southern Self-Replacing Index
- ◆ Southern Baldy Maternal Index
- ◆ Northern Self-Replacing Index
- ◆ Northern Baldy Terminal Index

Each selection index describes a different production/market scenario and relates to a typical self replacing commercial herd in temperate Australia using Hereford bulls and targeting the following specifications.

Southern Self-Replacing Index - Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing straight bred Hereford herd targeting the domestic market. Daughters are retained for breeding and so maternal traits are of importance. Steers are slaughtered at 20 to 22 months of age to produce 300 kg carcasses with 10 mm P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period.

Northern Self-Replacing Index- Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing herd targeting the domestic market. This index is suitable for use by both straight bred Hereford herds and in crossbreeding programs where Hereford bulls are being used over a *Bos indicus* based cow herd (e.g. flatback). Daughters are retained for breeding and so maternal traits are of importance. Steers are slaughtered at 20 to 22 months of age to produce 340 kg carcasses with 12 mm P8 fat depth. A high cost is applied for cow feed costs during the annual feed shortage period.

Southern Baldy Maternal Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd using Hereford bulls over *Bos taurus* females (e.g. Angus). A portion of the heifers are retained for breeding and so maternal traits are of importance. The steers and surplus heifers are destined for slaughter at 20 to 22 months of age. Steers produce 300 kg carcasses with 10 mm of P8 fat depth, while heifers produce 270 kg carcasses with 12 mm of P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period.

\$INDEX EXPLANATION

Northern Baldy Terminal Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd (e.g. flatback) using Hereford bulls over Bos indicus/Tropical females (e.g. Santa Gertrudis) where all progeny (male and female) are destined for slaughter. Steers and heifers are slaughtered at 20 to 22 months of age. Steers produce 340 kg carcasses with 14 mm of P8 fat depth while heifers produce 300 kg carcasses with 17 mm of P8 fat depth.

Carcase steer beautifully prepared by St Joseph's High School, Aberdeen. Placed on hoof and awarded Bronze Medal for carcass excellence in Market Specifications.

Carcass steer beautifully prepared by St Joseph's High School, Aberdeen.

Use these tables as a guide to compare individual animals with the current genetic level of the Hereford breed.

THE ELITE ADVANTAGE – OUR GENETIC TRENDS

Birth Weight (kg)

We are avoiding large increases in Birth Weights as we increase other growth traits. We see this as a vital contribution to increasing calving ease. Our birth weight now is the same as it was 17 yrs ago.

Calving Ease-Direct (%)

We consider it vital that heifers calve unassisted without resorting to another breed. Our selection pressure on this trait shows rapid progress can be made. We have done this without sacrificing growth or muscle.

THE ELITE ADVANTAGE – OUR GENETIC TRENDS

Gestation Length (Days)

Our herd gestation length has decreased as our CE daughters has improved

Calving Ease-Daughters (%)

We place much emphasis on the ability of a sire's daughters to calve unassisted. As can be seen, real progress can be made. These CE traits are genetic, ie permanent and cumulative in the breeding herd.

THE ELITE ADVANTAGE – OUR GENETIC TRENDS

200 Day-Growth (kg)

Our rate of progress is similar but ahead of the breed, however from a much lower birth weight

400 Day Weight (kg)

Our rate of progress is similar to the breed's but we have an advantage in actual EBV value.

THE ELITE ADVANTAGE – OUR GENETIC TRENDS

600 Day Weight (kg)

We are trying to avoid huge increases in 600 day weight so the maintenance cost of breeders doesn't become excessive.

200 Day-Milk (kg)

We try to have adequate milk for our environment.

THE ELITE ADVANTAGE – OUR GENETIC TRENDS

Carcase Weight (kg)

A vitally important carcase trait. Carcase weight can be improved without excessive 600 day weights

Carcase Eye Muscle Area (sq cm)

Our rate of progress in this vital component of yield is sustained and well ahead of the breed. Better muscling can contribute to increased feed efficiency.

THE ELITE ADVANTAGE – OUR GENETIC TRENDS

Carcase Intra Muscular Fat (%)

We are putting selection pressure on IMF to increase the eating quality of our end product.

Carcise RBY (%)

A vital commercial trait to improve, especially in anticipation of processor value based payments

THE ELITE ADVANTAGE – OUR GENETIC TRENDS

All our \$Index graphs demonstrate the superior earning ability of the Elite herd.

Southern Self-Replacing Index (\$)

Northern Self-Replacing Index (\$)

THE HELMSMAN SELLING SYSTEM - “Quiet and Buyer Friendly”

- ◆ **On arrival, intending buyers register and receive a buyer number.**
- ◆ When the sale commences, all the bulls are on offer simultaneously.
- ◆ **To bid on any bull, fill in the bid card with your Buyer No., Bull Lot No. and price you wish to offer and hand it in to the bid table or to a “runner”.**
- ◆ Bidding may be opened at the reserve on any bull. The reserve will be indicated on the bid board.
- ◆ Bids are recorded with the buyer number on a large board near the yards and bulls. Any number of bulls can be bid on at once and reference to the board will indicate if your bid still stands, or has been overbid.
- ◆ There is **no pressure** to commit to another bid. If your “first choice” bull goes over your limit, you can still bid on any other bull in the sale.
- ◆ **A bid once submitted and recorded, cannot be retracted and the person submitting such a bid will be responsible for it until it is overbid.**
- ◆ The sale will remain open **for a minimum of 20 minutes**. After this, at the discretion of the presenter, the 2 minute “no bid” time will commence. That is, a bid registered in the last 2 minutes will result in a 2 minute extension of time. **Any further bids trigger the same process until a full 2 minutes “no bid” period concludes the sale.**
- ◆ AuctionsPlus bids will take preference over onsite bids,

CONDITIONS OF SALE

1. Subject to the reserve price, the highest bidder shall be the purchaser, and in the event of any dispute arising it shall be settled by the presenter unless one of the claimants will advance, in which case the lot, or lots, shall be put up again.
2. **Payment shall be made and cleared prior to delivery. Therefore payment on sale day preferable.**
3. Registered agents who introduce new clients, attend the sale to assist their clients with bull selection and settle on behalf of their clients within 14 days of the sale, will be entitled to an agent rebate of 5% of the bid price. A 2% rebate will be paid to those agents who introduce potential purchasers, but do not attend the sale with the purchasers. In the event of delivery being made to, or possession being obtained by, the purchaser or his representative prior to payment of the purchase money, then, until payment in full of the purchase money or any cheques given on account of same, the purchaser is to hold the stock as trustee for the vendor.
4. If required by the vendor, the purchaser shall deposit the whole amount, or any part of the bid price, at any time during the sale.
5. All stock shall be at the risk of the purchaser and proforma delivery shall be deemed to have been given when the sale presenter closes the sale by the fall of the hammer.
6. As soon as practicable after the fall of the hammer, the purchaser shall sign the agreement for sale.
7. Lots will be offered simultaneously.
8. The purchaser authorises the sale presenter to sign on his or her behalf the Contract of Sale.
9. If the purchaser shall neglect, or fail to comply with any of the above conditions, any stock purchased by him or her may be immediately resold by public auction or private contract, with or without notice, at the risk of the former purchaser, who will be held responsible for all loss and expenses arising out of such a resale, and shall not participate in any profit accruing therefrom.
10. No person shall be entitled to bid unless, prior to the commencement of the sale, he or she has made arrangements, satisfactory to the vendor for the payment for any stock and/or property sold to him or her.
The vendor may refuse to accept any bid which, in her opinion, is not in the best interest of the vendor.
11. The HEREFORD GROUP BREEDPLAN Estimated Breeding Values contained in this catalogue were compiled by the Agricultural Business Research Institute (ABRI) from data supplied by the breeders. Neither the Herefords Australia nor ABRI oversee or audit the collection of this data.

Nominated as a previous Hereford Super Sire but retained at Elite as Stud sire. Now available as stud sire prospect. His calving ease and light birth wt. has resulted in all live calves, yet he has phenomenal growth at 400 days plus top 5% muscle and IMF. A great combination for MSA markets, Grass Fed or Feedlots. His dam is a valued E212 female with one excellent heifer and another top bull in this sale as Lot 42. Better than top 5% \$Indexes.
