

12th Annual BULL SALE

FRIDAY, FEBRUARY 17TH 2023 1PM, ON SITE @ OAK DOWNS

LOT 11 OAK DOWNS STRATFORD S25

LOT 32 OAK DOWNS SURGEON \$261

WELCOME

Welcome to our twelfth annual bull sale. We truly appreciate the support that we have received from clients over the past eleven years and the positive feedback of the bulls doing a great job over a large range of different climates. We are again excited to offer 40 top quality, structurally sound, easy doing sires for your appraisal .Please note that all bulls have been semen tested, vaccinated and raised on dryland pasture with no grain feeding and no foot trimming, giving you complete confidence in the reproductive integrity and health of the bulls on offer.

Rather than having a traditional open cry auction, we have decided to utilise the much more buyer friendly Helmsman System, taking the pressure off from the bidding experience.

This year all bulls have again been Genomic DNA tested to increase accuracy of breedplan, all bulls are sire verified and poll tested so that homozygous polled animals can be identified. If you would like any help with your sire selection, or have any questions, we will be very happy to assist and remember if you cannot make it on sale day, our auction is interfaced with AuctionsPlus, so you are able to bid from anywhere with internet connection.

If you are unable to make it on the 17th, please call to arrange a private inspection or visit us on Tuesday 7th February when all bulls will be on display during the Stock Journal Beef Week.

Regards,

ANDREW & VANESSA SCHWARZ

SALE INFORMATION

LOCATION

Sale to be held on property, "Oak Downs", 2466 Senior Road, Senior (via Bordertown), 5268 SA. From Bordertown, just East of overpass on highway take Senior Road, Oak Downs is approx. 25km on right. From Keith, take Emu Flat Road (1st on left as coming into Keith from Adelaide side of town), after 35km cross Ngarkat Highway, travel another 5km, turn right onto Senior Road. Oak Downs 1st on left. See map on back cover.

INSPECTION

From 10.30am on sale day. Private inspections may be arranged at any other time by appointment. Sale bulls will also be on display during SA Beef Week Field Days at Oak Downs on Tuesday 7th February.

DELIVERY

Free delivery within 400km radius of sale venue. While every care will be taken, no responsibility can be accepted by the vendors while awaiting delivery.

HEALTH

All sale bulls are officially Government confirmed as Brucellosis and T.B. free and have a Johnes status of J-BAS 6, free to all states except WA. All bulls have been PI tested negative for Pestivirus, vaccinated with Pestiguard, Vibrovax and 5in1 + B12 and have been backlined with Dectomax. All lots have been semen tested by Nationwide Artificial Breeders. Bulls have been raised their entire lives on dryland pasture with cereal hay supplementation during bloat season and no grain feeding. No bulls have had their feet trimmed.

INSURANCE

Buyers are reminded that purchases become their responsibility at the fall of the hammer. The vendors recommend insurance of all purchases for up to 12 months and for transit. The selling agent will have an insurance representative at the sale.

GUARANTEE

All bulls are guaranteed to be fertile and capable of natural service (excluding illness or injury) for a period of 12 months after date of sale. Purchase price, less salvage value, will be reimbursed upon vet inspection and certificate.

REBATE

3% rebate to outside agents who attend the sale with or on behalf of their client(s) and settle within 7 days of the sale. Agent is to co-sign the buyer's instruction slip.

1% rebate to outside agents not attending the sale but who introduce their client in writing not latter than 12 hours prior to sale and settle on buyers behalf within 7 days of the sale.

GST

GST is to be added onto the purchase price at the fall of the hammer. You will be invoiced purchase price plus GST.

ACCOMMODATION

Accommodation is available in Keith, Bordertown and Naracoorte.

LUNCHEON

Light luncheon and refreshments will be available.

<u>PLEASE NOTE:</u> Oak Downs and their representatives accept no liability for accidents that may occur. Any person attending does so at their own risk. All care has been taken in compiling this catalogue to ensure accuracy of information, but no responsibility is accepted for any errors or omissions which may have occurred.

Pestivirus is an insidious cattle disease. It can take from you before you know it.

It causes significant reproductive and performance issues, and weakens immune systems - leading to other costly cattle health problems like respiratory disease. In fact it costs the industry over \$114m every year.[1]

To protect your herd from pestivirus and optimise your returns, it pays to be on Pestigard.

Find out how easy it is at your local rural reseller or cattle vet.

EXPLANATORY NOTES FOR BREEDPLAN EBV'S

ESTIMATED BREEDING VALUES (EBVS)

EBVs for the growth traits are calculated in kilograms. The EBV is the best estimate of an animals genetic merit for that trait.

ACCURACIES

Accuracies are presented with every EBV and give an indication of the amount of information that has been used in the calculation of EBV. The higher the accuracy the lower the likelihood of change in the animal's EBV as more information is analysed for that animal and its relatives.

GROWTH EBV

MILK: 200 day milk EBV (kg) is an estimate of an animal's milking ability. For sires, the EBV is indicative of their daughter's milking ability as it affects the 200 day weight of their calves. **200**: 200 day growth EBV (kg) is calculated from the weight of the animals taken between 80 and 300 days of age.

BIRTH

BWT: Birth weight EBV (kg) is based on the measured birth weight of animals, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

400

400 day weight (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for dam age. This EBV is the best estimate of an animal's genetic merit for yearling weight.

600

600 day weight (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

EMA

Eye Muscle Area EBV (cm2) estimates genetic differences in eye muscle area at the 12/13th rib of a 300kg dressed carcase. More positive EBVs indicate more subcutaneous fat and earlier maturity.

RUMP

Rump Fat EBV (mm) estimates the genetic differences in fat depth at the P8 site of a 300kg dressed carcase. More positive EBVs indicate more subcutaneous fat and earlier maturity.

The Poll Hereford Group Breedplan Estimated Breeding Values contained in this sale catalogue were compiled by ABRI from data supplied by the breeders. Neither Herefords Australia nor the ABRI oversees or audit the collection of this data.

DESCRIPTION OF THE NEW HEREFORDS AUSTRALIA SELECTION INDEXES

Each of the new selection indexes describes a different production/market scenario and relates to a typical commercial herd using Hereford bulls. Producers are advised to use the selection index that most closely aligns to their production system. All four selection indexes are focussed on maintaining and improving eating quality. Significant premiums are applied for increasing marble score up to a marble score of 3. Pressure is also applied to early life growth to maintain low ossification scores and good MSA compliance. In addition, each selection index targets the following specifications.

Southern Self-Replacing Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing purebred Hereford herd targeting the domestic market. Daughters are retained for breeding and so maternal traits are of importance. Steers are slaughtered at 18 months of age to produce 300 kg carcases with 10 mm P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period.

Northern Self-Replacing Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing herd targeting the domestic market. This index is suitable for use by both straight bred Hereford herds and in crossbreeding programs where Hereford bulls are being used over a Bos indicus based cow herd. Daughters are retained for breeding and so maternal traits are of importance. Steers are slaughtered at 18 months of age to produce 340 kg carcases with 12 mm P8 fat depth. A high cost is applied for cow feed costs during the annual feed shortage period.

Southern Baldy Maternal Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd using Hereford bulls over Bos taurus females (e.g. Angus). A portion of the heifers are retained for breeding and so maternal traits are of importance. The steers and surplus heifers are destined for slaughter at 18 to 19 months of age. Steers produce 300 kg carcases with 10 mm of P8 fat depth, while heifers produce 270 kg carcases with 12 mm of P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period.

Northern Baldy Terminal Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd using Hereford bulls over Bos indicus/Tropical females (e.g. Santa Gertrudis) where all progeny (male and female) are destined for slaughter. Steers and heifers are slaughtered at 18 to 19 months of age. Steers produce 340 kg carcases with 14 mm of P8 fat depth while heifers produce 300 kg carcases with 17 mm of P8 fat depth.

HELMSMAN SELLING SYSTEM

Auctions don't have to be stressful environments. The Helmsman system combines the best features of an auction system and sale by private treaty.

You have more time to consider lodging your bid. You can place genuine bids on any bull of your choice at any time during the sale period.

You have the opportunity to reasses each lot during the sale period without any pressure to make an instant decision. You can take home the bulls you want, irrespective of lot order.

If you are considering buying a number of bulls you will have a better chance to average your purchase costs in order to meet your budget.

People say that the "Helmsman" system is buyer friendly because it helps them get better value for money. The simultaneous auction method enables them to switch to the best valued animal at any time during the sale.

HOW THE HELMSMAN SYSTEM WORKS

On arrival intending purchasers need to register and receive a bidding number.

All bulls are displayed for the inspection period and during the sale. When the sale commences all bulls are on the market simultaneously. You may bid on any bull regardless of lot number, by filling in a bid card with your bid price and buyer number and hand it to a "runner".

These bids will then be given to a central person in the order they are received and posted on a large board in the tent displaying bids and buyer numbers so you will be able to see at a glance whether your bid stands or has been over bided. Where bids of equal amounts are on the same animal the first bid received will be the standing bid.

A bid cannot be retracted.

You may open bidding at the reserve price indicated for each animal in the sale catalogue and contest bids in multiples as advised by the sales manager. If your "first choice" animal goes beyond your limits you can still bid on any other animal in the sale.

The sale will be open for 30 minutes. At the end of 30 minutes a 2 minute bid clock will commence. A bid on any lot will restart the countdown clock. Any further bids on any lot will trigger the same process until a full 2 minute "no bid" period will conclude the sale (or at the discretion of the sale manager).

All lots are open for sale for the full duration of the sale and all lots will conclude at the same time.

Sale is interfaced with AuctionsPlus and bids can be placed from anywhere with an internet connection.

UNDERSTANDING GENETIC CONDITIONS

Further details regarding each genetic condition is provided below.

Hypotrichosis (HY) - Partial to almost complete lack of hair. Affected calves are often born with very short, fine, kinky hair that may fall out leaving bare spots or areas particularly susceptible to rubbing. The condition may vary in expression as the animal matures and is usually less noticeable in older animals. The coat hair colour will sometimes appear "frosted" or "silverish." The tail switch may also be underdeveloped. Hypotrichosis is caused by a recessive allele which means that affected calves will only occur when two carrier animals are mated together. Hypotrichosis has been reported in the Hereford breed for many decades and is non-lethal. Carriers: Lots 11, 30, 38.

Dilutor (DL) - This is a coat colour abnormality that can be found when a Hereford bull that is a carrier of the dilutor gene is mated to a black cow. A certain number of the resulting calves are born with grey, smokey or chocolate coats (approx. 50%). Diluter is not an abnormality that causes any issues with calf performance. Dilutor is caused by a dominant allele, which means calves that are expected to have a black coat colour are born with a smoke colour coat because the dilutor allele is dominant to the black allele.

Idiopathic Epilepsy (IE) - Age of onset of first seizure can be variable, ranging from birth to several months of age. Occurrence and persistence of seizures may be influenced by environmental stress factors such as temperature extremes or increased physical activity. Upon initial onset of seizure episodes, individuals will typically lie on their side with all limbs extended in a rigid state. Manual flexing of the limbs is possible but return to the extended position occurs after release. Seizure episodes may last from several minutes to more than an hour. Idiopathic Epilepsy can lead to death and affected animals have not been known to reproduce. Idiopathic Epilepsy is caused by a recessive allele which means that affected calves will only occur when two carrier animals are mated together.

Maple Syrup Urine Disease (MSUD) – This is a condition which has been identified in both horned and polled Hereford animals. Affected calves display severe neurological signs within the first week of life. Typically, affected calves are dull and will become recumbent by 2 to 4 days of age. Affected calves will enter a state of terminal opisthotonus, where severe muscle spasms will cause their head, neck and spinal column to present in an "arching" position. Maple Syrup Urine Disease is fatal, with affected animals tending to die as young calves before they are old enough to reproduce. Maple Syrup Urine Disease is caused by a recessive allele which means that affected calves will only occur when two carrier animals are mated together.

Mandibulofacial Dysostosis (MD) – This condition may result in a facial malformation, which can include cleft palate, brachygraphic (short jaw) and camplygnathia (crooked jaw or face). Affected calves could display bilateral skin tags, attached to an unusual bone formation, just behind the corner of the mouth. Additional skin tags may be present near and/or below the ears. The calves' ears are sometimes small and floppy. Carriers: Lots 23, 26, 33, 34, 36, 37, 41 (all inherited from Allendale Imperial).

Jaw muscles are underdeveloped, and calves may have an elongated oral opening giving them the appearance of an exaggerated smile. Affected calves have a sucking reflex but will not suckle vigorously; calves that display additional cleft palate and/or shortened or crooked jaws will be further debilitated. While affected calves are typically born alive, they are not able to thrive. Mandibulofacial Dysostosis is caused by a recessive allele which means that affected calves will only occur when two carrier animals are mated together.

PUTTING UNDESIRABLE GENETIC CONDITIONS INTO PERSPECTIVE

All breeds of cattle, in fact all mammals including humans, have undesirable genetic conditions. Fortunately, advances in molecular genetics have facilitated the development of DNA tests for their management. Breed Societies are at the forefront of development of strategies to manage undesirable genetic conditions and seedstock members are leading the industry with their uptake of this technology.

How are the conditions inherited?

Research in the U.S.A. and Australia indicates that HY, IE, MSUD, MD and DL have different modes of inheritance. HY, IE, MSUD and MD are simply inherited recessive conditions, whereas DL is caused by a dominant allele.

Inheritance of HY, IE, MSUD & MD

Hypotrichosis, Idiopathic Epilepsy, Maple Syrup Urine Disease and Mandibulofacial Dysostosis are simply inherited autosomal recessive conditions. This means that a single pair of genes controls each condition. For this mode of inheritance two copies of the undesirable gene need to be present before the condition is seen; in which case you may get a calf with HY, IE, MSUD or MD. Animals with only one copy of the undesirable gene (and one copy of the normal form of the gene), that appear normal, are known as "carriers".

What happens when carriers are mated to other animals?

A carrier will, on average, pass the undesirable gene form to a random half (50 %) of their progeny.

When a carrier bull and carrier cow are mated:

- There is a 25% chance that the progeny produced will have two normal genes and so will never pass on the undesirable gene.
- $\bullet\,\,$ There is a 50% chance that the mating will produce a carrier.
- There is a 25% chance that the progeny will inherit two copies of the undesirable gene and hence be affected by the genetic condition.

When a carrier animal is mated to an animal tested free of the genetic condition:

- · All progeny will appear normal and will be unaffected by the condition.
- $\bullet\,\,$ There is a 50% chance that the mating will produce a carrier.
- There is a 50% chance that the progeny produced will have two normal genes and so will never pass on the undesirable gene.

Note that an animal that is tested free by DNA test of the genetic condition will not pass the genetic condition to its descendants, even if it has carriers in its own ancestry. Therefore, DNA-tested free animals can be used in your breeding program with confidence that they are not transmitting the unfavourable gene to subsequent generations.

Inheritance of DI

Dilutor is caused by a dominant allele, which means for this mode of inheritance calves that are expected to have a black coat colour will be affected by the condition if they inherit one or more copies of the undesirable gene. The condition will never be expressed in purebred Hereford animals, meaning that carrier animals may appear normal but possess either one or two copies of the undesirable gene.

What happens when carriers are mated to other animals?

An animal carrying one copy of the undesirable gene will, on average, pass the undesirable gene form to a random half (50%) of their progeny. An animal carrying two copies of the undesirable gene will pass the undesirable gene to 100% of their progeny.

When a carrier animal is mated to an animal expected to produce progeny with a black coat colour (e.g. Angus or Fresian animals):

- In cases where the carrier animal possesses one undesirable gene, there is a 50% chance that the mating will produce an animal affected by the condition.
- In cases where the carrier animal possesses two undesirable genes, there is a 100% chance that the mating will produce an animal affected by the condition.

When a carrier animal is mated to a purebred Hereford animal tested free of the genetic condition:

- All progeny will appear normal and will be unaffected by the condition.
- In cases where the carrier animal possesses one undesirable gene, there is a 50% chance that the mating will produce a carrier.
- In cases where the carrier animal possesses two undesirable genes, there is a 100% chance that the mating will produce a carrier.

When a carrier animal is mated is mated to a purebred Hereford animal that is also a carrier of the genetic condition:

- All progeny will appear normal and will be unaffected by the condition.
- · In cases where both carrier animals possess one undesirable gene, there is a 75% chance that the mating will produce a carrier.
- In cases where either of the carrier animals possesses two undesirable genes, there is a 100% chance that the mating will produce a carrier.

As with HY, IE, MSUD and MD, an animal that is tested free by DNA test of the genetic condition will not pass the genetic condition to its descendants, even if it has carriers in its own ancestry.

Livestock insurance that fits

In the livestock business, we understand it takes years to breed and produce your stock, which is why it pays to make sure you're protected if the unexpected occurs. Elders Insurance offers a wide range of risk protection options in one policy to cover any livestock enterprise you may be involved in. As we all know, there is always an inherent risk when transporting livestock but many of us forget about the risks while they are in the paddock. With every season and area being different it is important to consider all of the potential risks to your livestock and ensure you have suitable cover in advance for unforeseen circumstances involving your valuable livestock assets.
