Auctions Plus Helmsman sale

32 bulls

40 heifers PTIC

30 cows and calves not rejoined

inspection prior to sale day encouraged

All bulls never fed grain or pellets

All bulls vaccinated with 7 in 1 and

Vibrovax

Pestivirus free herd by vaccination

Bulls delivered free to most areas of N.S.W

All Bulls DNA tested, sire identified and free

of any genetic disorders

No bulls were assisted at birth

No foot trimming

See our written guarantee on pages 10-11

David Gardiner 0417 229690

Hello and welcome to Stanford Poll Herefords.

Many thanks to our supporters at last year's sale, a total clearance and average of \$7700 for bulls, \$4150 for cows & calves, and \$3675 for PTIC heifers. We couldn't be happier.

This year's bulls are the second in a row to have experienced good seasonal conditions since birth, and again it shows. They are sound, functional and commercially relevant with a range of types to suit different needs. As usual they are totally pasture fed without any supplements, which will lead to a longer working life and less disappointments when you get them home.

Grassmere Gallant 244 (Imp NZ) has in my opinion been the best AI sire we have used in many years. These are the first of his progeny to be offered in Australia. We have retained a stud sire by Gallant and a number of the sale bulls have been used over stud and commercial heifers.

Heifer bulls have sold very well over the last few years with repeat buyers recognising the value they add to their business. How many heifers / calves do you need to save to pay for a good heifer bull? With the rebuild all but complete it will be interesting to see if the trend continues.

A lifetime in the stud industry has seen many trends and fads come and go. Mid last century stud breeders overdid early maturity, leading to so called belt buckle cattle and dwarfism. In the 80's, 90's and later, they overdid the tall lean too big thing. You have to wonder if the current trend of continuing to chase the so called " Top " EBV's for every trait

imaginable will also, or has already been, overdone, and will we just end up with high maintenance cattle that don't suit the environment we run them in. There are very few free lunches in this game.

How often do you see the quote; "It's so rare to find a bull with the right phenotype" AND "such good figures"??? To me this suggests that many bulls with good phenotype i.e.: They are the right shape, size, soundness, maturity pattern, etc. are getting overlooked because stud breeders don't think the figures are good enough. I'm not suggesting the figures are wrong. I am suggesting that a little more thought needs to be given as to what EBV's are the most suitable for the environment they will be run under, with the breeding herd, and those nasty droughts, uppermost in your mind. Top commercial producers are already thinking along these lines.

The strengths of our herd lie in the fertility and survival traits which are so often overlooked in today's EBV race. Our herd is above average for calving ease both direct and daughters, birth wt (lower), mature cow wt (lower), gestation length, and rump fat. For you this means more live calves, higher stocking rates, better doing ability, and less cows on the truck at preg testing. Difficult to skite about at the saleyards but profitable nonetheless.

Above all we aim to ensure they are sound structured, user friendly, suitable for your environment, and stay in your herd for a long time.

And remember, nothing beats Herefords for fertility, temperament and doing ability, so be proud of them.

*Best regards
Michael Rutherford*

SALE ARRANGEMENTS

Auctions Plus Helmsman Sale 1:00 pm, Inspection from 10:00 am on sale day or prior to sale day by arrangement.

A rebate of 2% for bulls and 1% for heifers to outside agents introducing buyers prior to the sale and settling within seven days.

Supplementary sheet will be available on sale day.

HELMSMAN SALE Online only

AUCTIONS PLUS terms and conditions apply
www.auctionsplus.com.au

1. All lots are on the market simultaneously.
2. You may bid on any lot or lots at any time during the sale.
3. Each lot will have a starting price and bidding will commence at that price.
4. Bids for bulls will be \$500 and females \$50.

THE BENEFITS

1. You have more time to consider your bids. You can bid on any lot at any time, no pressure to make that instant decision.
2. You have time to reassess during the sale. If your 1st choice goes beyond your budget, you still have access to any other lot.

Bulls and Females will be yarded on property from 10:00 am

Bidding will be online only

Nutrien Livestock will be in attendance

STANFORD POLL HEREFORDS

The Rutherford and previously Gardiner families have bred registered Poll Hereford cattle since 1957. The Stanford prefix was established in 1974 with a base of Hopetoun and Sandalwood females. The Stanford and Hopetoun Stud's were merged in the mid 1980's. Genetics to have a significant influence since then have come from Wyregal, South Bukalong, Boonah, Wynella, Croft Ambrey, Lachlan Dale, Llandillo, Billillingra, Rotherfield, Oldfield, Wirruna, Yavenvale and NZ bloodlines.

The herd has been performance recorded with breedplan since 1985 with the early adoption of ultra sound scanning. Our herd was awarded a Certificate of Excellence in the NSW Seedstock Producer of the Year competition both times that we participated.

Today we run over 300 stud and 350 commercial breeders. We breed cattle entirely for their commercial attributes. We do not show them as we prefer to focus on productive traits. We have been calving our heifers at 2 years of age for many years and any female not joining in 9 weeks or requiring assistance is culled. Our cattle are selected for fertility, calving ease, structural soundness, performance and market suitability and have generations of inbuilt productivity. All our steers are sold direct to feedlots.

All calves are weighed at birth, weaning, yearling and again at 18 months. They are also scanned for fat depth, eye muscle area, and intramuscular fat percentage. All bulls are measured for scrotal size as yearlings and again before sale.

Although most calves are sired naturally, we have a well established annual A.I. program to trial new bloodlines.

SUCCESS WITH STEERS

Steers from Stanford have performed well above average in the Australian National Field Days Steer Trial comprising both grass and grain feeding. Over three trials our steers have been awarded prizes for 1st , 2nd and 3rd place pen of three carcasses and 1st, 2nd and 4th place for weight gain on grain. Importantly these results were achieved against all breeds and their crosses. Consistency counts.

FERTILITY AND STRUCTURAL SOUNDNESS

This should be your most important consideration when selecting bulls. Our sale bulls have been inspected by Blayney Veterinary clinic. This included feet, legs, eyes, jaws, testes, sheath, and penis. A service test has not been included this year as time has not allowed, however we, of course, still guarantee them capable of doing the job.

Our bulls are entirely pasture reared as this has proven to extend working life in your herd by up to two years over grain fed bulls, according to work done by Dr Mike Blockey. We believe that your grass fed bulls shouldn't reach maximum mature weight before four years of age. If your bull only weighs 700kg at 2 years, relax, as long as he is fit and healthy you are well on the way to owning a very profitable bull as he is likely to last longer than a heavier bull.

DNA / POLL / HORN STATUS

All bulls have been DNA tested

Bulls with (PP) in the lot heading are pure poll.

Bulls with (P) or (S) in the lot heading are heterozygous poll.

No bulls carry any recognised genetic disorder, EBV accuracy is enhanced, and parentage is confirmed.

BREEDPLAN EBV's

Group Breedplan provides the most accurate reports on production traits available to the industry. In fact, Group Breedplan is the only valid method for comparing cattle from different herds for growth, milk and carcass traits. The practice of comparing actual weights or carcass scans of animals from different herds is meaningless as most of the differences will be caused by factors such as type of country, climate, stocking rate and feeding regimes. Group Breedplan can save you heaps by identifying the actual genetic growth potential in grass fed bulls. The assessment of an animals genetic make up is expressed as an Estimated Breeding Value or EBV measured in Kg liveweight. It is based on an animals own comparative performance plus that of its relatives, while taking into account environmental effects. The figures shown here can be directly compared with those of other participating Poll Hereford Group Breedplan herds.

CALVING EASE EBV's are based on birth weight and calving ease recorded at birth. They will range from about -10 to +10 with the more positive EBV 's indicating easier calving. Use these when selecting heifer bulls.

BIRTH WEIGHT EBV's may be used to advantage in reducing calving problems in your heifers; the lower figures being more desirable. These should be used in association with such physical characteristics as smooth shoulders and finer bone. Ask us about Heifer bulls, a percentage of our bulls are now bred specifically for heifer joining, and we can advise you on the most likely prospects.

MILK Breedplan is able to split pre weaning performance into growth and milk genes. The EBV for milk in a bull represents the potential for him to pass on milking ability to his daughters. More milk in your cows can help you produce heavier, sappier vealers or reach market weight sooner. Too much milk however, can lead to more dry cows in a bad year, higher rates of udder breakdown in a good year, and more grass tetany problems.

GROWTH 200, 400 & 600 day growth EBV's are a measure of an animals inherent ability to grow to weaning, yearling and older weights, providing feed is available. More growth can help you reach target weights sooner or sell heavier cattle at the same age, however you may also find them harder to finish at younger ages. Larger breeding cows also require more feed than more moderate cows.

CARCASS

Rump fat EBV's expressed in mm, and eye muscle area EBV's expressed in square cm are derived from ultrasound scanning conducted on all yearlings. Visual muscle score will also prove useful. More muscular carcasses with the right amount of fat cover achieve significant premiums in the market place, currently about 20 cents / kg for each increase of one visual muscle score. Note, visual muscle score is a better indicator of carcass yield than EBV's.

IMF (Intramuscular Fat) % EBV is the estimate of the genetic difference in the percentage of IMF at the 12/13th rib on a 300kg carcass - more positive values would be favourable for the Japanese market, and for meat quality in general.

AN IMPORTANT MESSAGE ABOUT GROWTH

On most properties with standard or higher stocking rates the main limiting factor for cattle growth rates is either feed availability (usually autumn and winter) or feed quality (summer and autumn) , assuming parasites have been controlled. This leaves only 3 to 4 months of each year when cattle can grow to their potential. For the remaining 8 months of each year they can only grow as fast as the limited quantity / quality of feed will allow – **No matter what their potential growth rate is.**

You will also find that the greater the gap between their potential growth rate and that allowed by the limited quantity / quality of feed, then the leaner the animal will become when put under stress such as calf rearing / cold winters etc.

This has serious implications for your breeding herd which on most farms will consume 70 to 80 % of feed grown for the cattle enterprise. If the growth potential of your herd exceeds the feed base provided to it by too much then **leanness becomes a problem for 8 months of the year and herd fertility will suffer**. The effect will be greatest on your heifers calving at 2 years.

You then have two choices

1. Reduce your stocking rate substantially. (ouch.) or
2. Try to match the cattle more closely to the environment.

Let's face it ; to be serious in cattle breeding these days you really have to be calving at 2 years in spring and you have to be thinking in terms of Kg / Ha , not Kg / head.

If you think you can identify with this message then you will realize that bigger is not necessarily better when it comes to growth EBV's. There are no free lunches, bigger cattle need more feed.

Before Breedplan we used to call it constitution or doing ability or in another way, early / late maturity patterns. What is the point in having 700 kg steers that still aren't finished. Their sisters will really struggle as they won't carry enough fat.

In our commercial operation we find that all the higher priced markets available to us can be adequately supplied using moderate growth bulls whilst also keeping cow size sensible.

Breed avg. EBVs for 2021 Born Calves

YOUR GUARANTEE
NOW COMES IN TWO PARTS

PART 1

Fertility

(valid for 12 months following purchase)

We guarantee that our bulls are capable (excluding injury or disease occurring after purchase, and assuming you have kept him in good working condition) of achieving conception rates of 90% (85% for autumn and early winter calving herds) when mated to up to 50 females for nine weeks, providing your cows are healthy and cycling. If your bull does not produce the expected number of calves or pregnancies as a result of the failure of his own fertility (Vet. certificate required), we will:

- replace him with a bull of equal value at no charge.
- Give you a credit to the tune of \$50 for each empty cow (up to the guaranteed level).

PART 2

Structural soundness (valid for 2 years following purchase)

The average working life of a bull in south eastern Australia is three years. While we make every endeavor to ensure that all bulls sold are sound, it is often difficult to foresee how a young bulls feet, hips etc. will perform in the years ahead.

We are prepared to guarantee that you will get at least the average three seasons from our bulls and it works like this:

Assuming your bull completes his first mating successfully, but presents in an unsound condition for his 2nd (due to feet, leg or hip problems not caused by injury or disease) we will provide you with a bull of equal value at a 60% discount. If at the end of 2 years your bull, having completed 2 successful matings, presents in an unsound condition prior to his 3rd mating, we will provide you with a bull of equal value at a 30% discount, thus ensuring that you receive the full value of your original purchase.

Remember, if for any reason you are disappointed with your purchase, please let us know, and we will do our best to help. With this type of feedback, you can help us to produce a better article
