Kenny Creek's Angus Introduction

AS I HAVE TRAVELED THE WORLD over the last few years talking about beef and developing our beef export sales it has been with great pride that I have been able to associate myself and our beef business with Kenny's Creek Angus. Our close association with the leading genetics in the Angus breed continues to open doors for us all over the world.

Our belief remains that our clients should benefit from our genetics not only from our bulls but also from our female line.

Over the last decade I have developed my interest in the Angus breed by focusing on different stages in the beef supply chain – firstly in my career as a butcher, and then as a meat exporter, and most recently through my involvement in feed lotting Angus cattle. Through each of these businesses I have learnt different performance attributes of the Angus breed. I am now looking to each of these interests to focus my energies towards Kenny's Creek Angus and the continued evolution of the stud herd.

In September this year our family made the decision to hand over the role of principal of Kenny's Creek Angus stud to me. I would like to pay homage to my parents, Nick and Julia, for their vision in developing an industry leading Angus stud over 25 years and the commitment they have shown in building this most outstanding of herds. There have been plenty of tough years as many would know but Nick and Julia have been absolute in their focus.

In becoming a more formal part of this team I would also like to acknowledge the excellent work which Adam Withers has and continues to do as stud manager. It has been well noted in our cattle that they display a consistency in type, functionality and breeding, which Adam has honed in his time with Kenny's Creek.

This point in the history of Kenny's Creek Angus leads very neatly into this sale. As many readers would recall, in previous years we have had an Autumn and Spring offering of bulls. In recent years clients dependence on the Autumn sales has diminished and in order to simplify our breeding operation we are now looking to disperse all of our Autumn calving females.

In 2014 we held a total clearance of our HBR females over the age of three. The same principle can be applied to this sale – there has not and will not be any half measures in the way we sell females. Our belief remains that our clients should benefit from our genetics not only from our bulls but also from our female line. Our Autumn calving heifers and cows will be offered without exception plus twenty spring calving cow/calf units at our 12 December sale.

Our team encourages you to take the time to review our breed objectives, to speak to some of our clients and others who have experienced our cattle. I believe that whilst we have been relatively modest in the promotion of our cattle over the last 25 years, the depth and sentiment of our client base speaks to the quality of our cattle.

Sam Burton Talyor
October 2016

The Kenny's Creek Program

THE SELECTION AND BREEDING program at Kenny's Creek is driven by a systems based approach that has at its heart a rigorous and a non-emotional approach to genetic selection. It seeks to produce trouble free performance bulls for our clients.

A brief summary of the key points of our approach is as follows:

SIRE SELECTION

Kenny's Creek has been at the forefront of making use of structural information, with every animal in our breeding herd scored at least every two years. We have amassed over 100,000 individual items of data. We have developed systems to analyse this data and rank the performance of sire and cow lines. This has sometimes given surprising feedback that enables us to react early to structural issues inherited by sire lines.

We take the attitude that a new sire has too "squeeze its way" into our program. We comprehensively examine sires including viewing progeny, dams, granddams, sisters and any other family members available.

We don't feel it is noteworthy to boast a high cull rate of bulls presented for sale as this demonstrates a lack of research and homework on matings. A low cull rate for us means more predictable progeny for our client's herds. We aim through tightly researched breeding principles and using high accuracy parents, to reduce mistakes and minimize surprises.

Once sires have passed this assessment we then look at EBVs, either on Angus Breedplan or multi-breed Breedplan. We keep in mind that some of our clients sell steers to the domestic market and some look at the Long Fed index. We are not a "one - index" breeder.

FEMALES

We run an elite herd of cows that are constantly assessed and reassessed for the inclusion in the donor group. We are currently producing in excess of 600 embryos per year and have implanted 500 recipients for the program.

We are constantly looking for new females outside our herd to challenge our own females. However, any selections are subject to the same stringent tests we apply to our own females. Consequently it is not surprising that we have a high "casualty" rate with "bought in" females.

INTERNATIONAL BENCHMARKING AND GLOBAL NETWORK

As the Kenny's Creek herd have such strong carcase qualities we have found that we can complement the New Zealand bloodlines well and incorporate their excellent structure and functional qualities. We are annual visitors to overseas breeders who we regard as leaders in their country.

Independent Evaluation Our protocol for breeding soundness has four elements to it.

1. Assessment of structural soundness. All our bulls have been assessed independently for structural soundness. In the case of our females we assess them at their first lactation and continue this practice at regular intervals throughout their lives. No females remain in the donor or breeding program that have short comings on their structural assessment which includes a rigorous 'life time' evaluation of temperament.

Structural soundness is also assessed in all sires introduced to the program via artificial insemination. We use a range of trusted consultants in the event we have difficulty in evaluating the bull ourselves. To allow a new bull onto our sire list we review his female progeny for as many generations as possible.

2. Physical evaluation of testicular and penile function. This test is carried out by a qualified Veterinary Scientist and is performed on all sale animals.

3. Physical observation of serving ability. While difficult and time consuming no test better indicates a bulls libido and unmistakable ability to serve a cow than a serving ability test. All bulls are confirmed as achieving a satisfactorily mount and service of a cow. This test is performed under Veterinary Scientist's supervision and is independently verified for each bull. No short cuts allowed.

4. Evaluation of testicular function.

Experienced testicular palpation is an extremely accurate method of detecting semen quality problems which may interfere with natural mating. Any abnormalities are thoroughly checked with a semen quality test.

INDEPENDENCE AND TRANSPARENCY

Kenny's Creek is not "mortgaged" to anyone else's program. We do not have to compromise our objectives to suit any other players other than our own clients.

All the information that we collect and that will help clients in making an informed decision is published in our catalogue or our website.

MOTIVATION

We enjoy what we do and are happy to stand by what we produce.

Manager's Comment

IN THIS YEAR'S KENNY'S CREEK female sale all Autumn PTIC females will be for sale including 60 pregnancy tested Autumn calving cows and 30 pregnancy tested Autumn L calving heifers. Also on offer will 10 PTIC spring L heifers, these heifers are well grown and will be joined to Lotto L3 and EF Complement. Starting the sale will be 22 cow/calve units, calves born Spring 2016. The oldest cow on offer will be a G cow. Sires of the calves are Hallmark, Generation 2100, SynGen Blackpearl and SAV Resource. This is the first chance to purchase Generation 2100 progeny in Australia and the last chance this year to purchase an Ascot Hallmark calf.

Our stud cows and calves are run under commercial conditions on mostly improved pastures with supplementary feeding occurring when necessary. This allows the collection of realistic early growth and milk production data for our cattle and starts the process of culling for poor performers.

Calves are weaned at approximately 5 to 7 months depending on the season. All the calves are vaccinated again with 7 in 1 and the bull calves vaccine with Vibriosis vaccine as well as being drenched. Bulls and heifers are separated at weaning and each group run separately which allows a good comparison of various genetics and the collection of meaningful data on growth and carcass traits data.

During the winter in the Boorowa area the weaner bulls and heifers are supplemented enough to maintain some growth while there is no pasture growth. When spring pasture becomes available the bulls are then given access to improved pasture for as long as it lasts.

During their time at Kenny's Creek all young cattle are visited frequently and are familiar with vehicles, people on foot and horses. Cattle are handled with horses, quiet dogs and motorbikes.

We place great emphasis on temperament in our cattle both in the paddock and in the yard. They are used to being worked in yards and the paddock with a minimum of labour.

Adam Withers

Kenny's Creek Stud Manager
October 2016

Performance and Animal Health

HEALTH STATUS

Bovine Johne's Disease (BJD). The Kenny's Creek Angus herd (both stud and commercial cattle) covering all our Boorowa properties, has been assessed and tested under the National Johne's Disease Market Assurance Program and holds MN2 (Monitored Negative 2) Status. No further testing required transporting bulls Australia wide.

Pestivirus. Pestivirus is an endemic viral disease in Australia. There is serological evidence of pestivirus in greater than 70% of beef herds in NSW. A pestivirus management plan was commenced in the Kenny's Creek herd. This involved exposing all weaner cattle to the virus. All exposed animals have lifetime immunity.

Refer to our website for further information.

FEET AND LEGS

Great attention has been paid to both feet and legs in our breeding program and no feet are ever trimmed. The soft country that all our stud cattle run on shows up quickly in the feet if problems exist.

RED GENE

It is important to be aware that the red gene exists in Angus cattle and has done so since foundation. While the black gene remains dominant the red colour will surface if both the sire and dam carry the red gene. Obviously this is more likely in cross breeding situations.

TEMPERAMENT

Temperament in our whole herd is assessed constantly and ruthlessly. This policy has been in place for 25 years. It is always possible through the use of overseas sires to inadvertently import a problem. However, to mitigate against this we always obtain direct reports on any temperament issues prior to using new sires. Clearly all working bulls are selected, in part for their libido and fertility attributes and as such require an understanding management approach in their handling.

SALE CATALOGUE DISCLAIMER

All reasonable care has been taken by the vendor to ensure that the information provided in this catalogue is correct at the time of publication. However, neither the vendor or the selling agents make no other representations about the accuracy, reliability or completeness of any

information provided in this catalogue and do not assume any responsibility for the use or interpretation of the information included in this catalogue. You are encouraged to seek independent verification of any information contained in this catalogue before relying on such information.

Recessive Genetic Conditions

THIS IS INFORMATION FOR buyers about the recessive genetic conditions, Arthrogryposis Multiplex (AM), Hydrocephalus (NH), Contractural Arachnodactyly (CA) and Developmental Duplications (DD).

PUTTING GENETIC RECESSIVE CONDITIONS IN PERSPECTIVE

All animals, including humans, carry single copies (alleles) of undesirable or “broken” genes. In single copy form, these undesirable alleles usually cause no harm to the individual. But when animals carry 2 copies of certain undesirable or “broken” alleles it often results in bad consequences. Advances in genomics have facilitated the development of accurate diagnostic tests to enable the identification and management of numerous undesirable or “broken” genes. Angus Australia is proactive in providing its members and their clients with relevant tools and information to assist them in the management of known undesirable genes and our members are leading the industry in their use of this technology.

Key point: With today's DNA tools undesirable genetic conditions can be managed.

WHAT ARE AM, NH, CA AND DD?

AM, NH, CA and DD are all recessive conditions caused by “broken” alleles within the DNA of individual animals. When a calf inherits 2 copies of the AM or NH alleles their development is so adversely affected that they will be still-born.

In other cases, such as CA and DD, calves carrying 2 copies of the broken allele may reach full-term. In such cases the animal may either appear relatively normal, or show physical symptoms that affect their health and/or performance.

Key point: The number of reported observations of AM, NH, CA and DD calves is very low and there is certainly no need for panic.

HOW ARE THE CONDITIONS INHERITED?

Research in the U.S. and Australia indicates that AM, NH, CA and DD are simply inherited recessive conditions. This means that a single gene (or pair of alleles) controls the condition. For this mode of inheritance two copies of the undesirable allele need to be present before the condition is seen; in which case you may get an abnormal calf. A more common example of a trait with a simple recessive pattern of inheritance is black and red coat colour.

Animals with only one copy of the undesirable allele (and one copy of the normal form of the allele) appear normal and are known as “carriers”.

WHAT HAPPENS WHEN CARRIERS ARE MATED TO OTHER ANIMALS?

Carriers, will on average, pass the undesirable allele to a random half (50%) of their progeny.

When a carrier bull and carrier cow is mated, there is a 25% chance that the resultant calf will inherit two normal alleles, a 50% chance that the mating will result in a carrier (i.e. with just 1 copy of the undesirable allele), and a 25% chance that the calf will inherit two copies of the undesirable gene.

If animals tested free of the undesirable gene are mated to carrier animals the condition will not be expressed at all. All calves will appear normal, but approximately half (50%) could be expected to be carriers.

Key point: For the condition to be expressed the undesirable gene needs to be present on both sides of the pedigree and both the sire and dam need to be a carrier.

HOW IS THE GENETIC STATUS OF ANIMALS REPORTED?

DNA-based diagnostic tests have been developed which can be used to determine whether an individual animal is either a carrier or free of the alleles resulting in AM, NH, CA or DD.

Angus Australia uses advanced software to calculate the probability of (untested) animals to being carriers of AM, NH, CA or DD. The software uses the test results of any relatives in the calculations and the probabilities may change as new results for additional animals become available.

The genetic status of animals is being reported using five categories:

- **AMF:** Tested AM free
- **AMFU:** Based on pedigree AM free – Animal has not been tested
- **AM %:** % probability the animal is an AM carrier
- **AMC:** Tested AM-Carrier
- **AMA:** AM-Affected

For NH, CA and DD, simply replace AM in the above table with NH, CA or DD.

Registration certificates and the Angus Australia web-database display these codes. This information is displayed on the animal details page and can be accessed by conducting an “Animal Search” from the Angus Australia website or looking up individual animals listed in a sale catalogue.

Key point: The genetic status of an animal is subject to change and will be re-analysed and adjusted each week as DNA test results of relatives are received.

IMPLICATIONS FOR COMMERCIAL PRODUCERS

Your decision on the importance of the genetic condition status of replacement bulls should depend on the genetics of your cow herd (which bulls you previously used) and whether some female progeny will be retained or sold as breeders.

Most Angus breeders are proactive and transparent in managing known genetic conditions, endeavouring to provide the best information available. The greatest risk to the commercial sector from undesirable genetic recessive conditions comes from unregistered bulls with unknown genetic background. The genetic condition testing that Angus Australia seedstock producers are investing in provides buyers of registered Angus bulls with unmatched quality assurance.

For further information contact Angus Australia's Breed Development and Innovation Manager at (02) 6773 4602.

Understanding Estimated Breeding Values (EBVs)

ESTIMATED BREEDING VALUES (EBVs) are predictions of an animal's genetic merit, based on available performance data on the individual and its relatives.

EBVs are expressed in the units of measurement for each particular trait. They are shown as +ive or -ive differences

from the breed base. As the breed base is set to a historical benchmark, the average EBVs of animals in each year drop has changed over time as a result of genetic change within the breed. The current breed averages are shown below. These averages provide a useful benchmark for comparing EBVs for animals.

BREED AVERAGES FOR 2014 DROP CALVES

	Calving Ease Dir	Calving Ease Dtrs	Gest Length	Birth Wt	200 Day Wt	400 Day Wt	600 Day Wt	Mat Cow Wt	Milk	Scrotal Size
	-0.2	-0.1	-3.5	+4.3	+41	+75	+98	+86	+14	+1.6

Days to Calving	Carc. Wt	EMA	Rib Fat	Rump Fat	RBY %	IMF %	Angus Breeding	Domestic	Heavy Grain	Heavy Grass
-3.6	+54	+4.4	+0.0	+0.0	+0.3	+1.5	+\$102	+\$101	+\$104	+\$102

CALVING EASE TRAITS

Calving Ease (DIR): estimate of genetic differences among animals in the ability of their calves from 2 year old heifers to be born unassisted. Higher, more +ive, Calving Ease (DIR) EBVs are more favourable.

Calving Ease (DTRS): estimates of genetic differences among animals in the ability of their 2 year old daughters to calve without assistance. Higher, more +ive, Calving Ease (DTRS) EBVs are more favourable.

Gestation Length: estimate of genetic differences among animals in the number of days from the date of conception until the calf birth date. Lower, or more -ive, Gestation Length EBVs are generally more favourable.

Birth Wt: estimate of genetic differences between animals in kg of calf birth weight. Calf birth weight is the biggest contributing factor causing calving difficulty in heifers. While low Birth Wt EBVs are favoured for calving ease they are also often associated with lower growth potential. Small, or moderate, Birth Wt EBVs are more favourable.

FERTILITY TRAITS

Days to Calving (DC): estimate of genetic differences among in female fertility, expressed as the number of days from the start of the joining period until subsequent calving. Females with shorter DC EBVs tend to commence cycling earlier after calving and conceive earlier in the joining period. They also tend to attain puberty at a younger age as heifers. Lower, or more -ive, Days to Calving EBVs are more favourable.

Scrotal Size: estimate of the genetic differences among animals in scrotal circumference at 400 days of age. Increased scrotal size is associated with increased semen production in bulls, and earlier age at puberty of bull and heifer progeny. Larger, or more +ive, Scrotal Size EBVs are more favourable.

GROWTH TRAITS

200-Day Wt: estimate of the genetic differences among animals in weight at 200 days of age. This is a measure of an animal's early growth to weaning. It is an important trait for breeders turning off animals as vealers or weaners.

400-Day Wt: estimate of the genetic differences among animals in weight at 400 days of age. This is an important trait for breeders turning off animals as yearlings.

600-Day Wt: estimate of the genetic differences among animals in live-weight at 600 days of age. This is an important trait for breeders targeting the production of animals suited for heavy weight grass finished or grain fed market

MATERNAL TRAITS

Milk: estimate of the genetic differences among animals in milk production potential, expressed through variation in calf growth performance. Larger, more +ive, or moderate, Milk EBVs can be more favourable, depending on the environment.

Mature Cow Wt: estimate of the genetic differences among animals in cow weight at 5 years of age.

CARCASE TRAITS

Carcase Wt: estimate of the genetic differences among animals in hot standard carcase weight at 750 days of age. Larger, more +ive, Carcase Weight EBVs are more favourable.

EMA: estimate of the genetic differences among animals in eye muscle area (cm²) at the 12/13th rib site on a 400kg carcase. Larger, more +ive, EMA EBVs are generally more favourable.

Rib Fat: estimate of the genetic differences among animals in fat depth (mm) at the 12/13th rib site, measures on a 400kg carcase. More positive (+ive), or more negative (-ive), Rib Fat EBVs may be more favourable, depending on your breeding goals. (*Continued over*)

CARCASE TRAITS *Continued*

Rump Fat: estimate of genetic differences among animals in fat depth at the P8 rump site on a standard 400kg carcase. More positive (+ive), or more negative (-ive), Rib Fat EBVs may be more favourable, depending on your breeding goals.

IMF%: estimate of genetic differences among animals in percentage intramuscular fat (marbling) in a 400kg carcase.

EFFICIENCY TRAITS

Net Feed Intake (NFI): estimate of the genetic differences between animals in efficiency. NFI is measured either post weaning (NFI-P), in young bulls and heifers, fed at around 300 days of age, or in steers fed at around 560 days of age (NFI-F). Lower, more negative (-ive) NFI EBVs are more favourable.

TEMPERAMENT TRAITS

Docility: estimate of genetic differences between animals in temperament. Docility EBVs are expressed as differences in the percentage of progeny that will be scored with acceptable temperament (ie. either "docile" or "restless"). Higher Docility EBVs are more favourable.

\$INDEX VALUES

Angus Breeding: estimates the genetic differences between animals in net profitability per cow, joined in a typical commercial self-replacing herd using Angus bulls. This selection index is not specific to a particular production system or market endpoint, but identifies animals that will improve overall profitability in the majority of commercial grass and grain finishing beef production systems. The index is particularly suited to commercial producers who sell progeny into different markets, or to seedstock producers supplying bulls to commercial clients who produce for a range of different production systems and market end points.

Domestic: estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing herd targeting the domestic supermarket trade, with progeny finished using either grass, grass supplemented by grain or grain finishing systems.

Heavy Grain: estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing herd targeting pasture grown steers with a 200 day feedlot finishing period for the grain fed high quality, highly marbled markets.

Heavy Grass: estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing herd targeting pasture finished heavy steers.

TRAITS OBSERVED

Indicates the traits that have been recorded for a particular animal and are contributing to the EBVs that have been calculated. These will appear directly below the table displaying the animals EBVs.

UNDERSTANDING ACCURACIES

The accuracy associated with an EBV gives an indication of its reliability, and the likely extent of its possible change as more information becomes available. As more data becomes available on animals (or its progeny, or relatives) then the accuracy of its EBVs for particular traits will increase.

Accuracies are influenced by the heritability of traits and the genetic associations existing between them. For lowly heritable traits, more information is required to achieve a similar accuracy to that of highly heritable traits. Accuracies are expressed as percentages. The higher the percentage, the greater the chance that the EBV is a close estimate of the animal's true genetic merit, and the less likelihood that the EBV will change as more information becomes available.

Foundation Cows at Kenny's Creek

Bara K150

BARA FAMILY

Started with the purchase of K150 in 1991, she was a 1990 drop calf. K150 grew into a moderate framed cow, very docile, fertile and trait leading carcase. Showing tremendous longevity and living until nearly 22 years of age. Even now she is +4.3 Calving Ease and +2.1 IMF with 91 registered progeny in 6 herds. Some standout daughters are U72 with 14 progeny, Q120 with 66 progeny, Y120 with 22 progeny, A341 and D147. The Bara family continues to express these traits now.

Fink Miss X56

FINKS MISS FAMILY

Embryos were imported from Fink Beef Genetics, Kansas USA in 2001. The donor cow was Finks Miss 8315 and the sire was GAR Precision 1680. From these embryos there were 8 daughters. Kenny's Creek used X56 as a donor cow resulting in 12 progeny. Other females from these embryos are X34 purchased by Welcome Swallow, X44 purchased by Old Bundemar and X51 purchased by Bill Cornell at St. Pauls Angus. Top priced cow in 2014 was D118 purchased by Moore Park Livestock, Glen Innes. The Finks Miss family has a very consistent phenotype and extra thickness and body depth.

Mittagong V254

MITTAGONG FAMILY

V254 purchased from Te Mania in 2004, she was a productive donor cow having 87 progeny in 5 herds. Her daughters have been donors at Sterita Park, Te Mania and Paringa. Daughters have bred on particularly well, like C27 with 28 progeny, who was sold in 2014 to Redbank Angus. Sons of V254 have regularly topped bull sales. The Mittagong family breeds exceptional phenotype and strong maternal dams.

PATRIOT FAMILY

Gets its name from sire Lord Patriot, the corner stone cow was T97 with 55 progeny. Other donor cows have been W37 with 62 progeny and X320. The Patriot cow line is one of the bigger framed cow families at Kenny's Creek.

Patriot W37

SATURN FAMILY

Started with Scotch Cap OB45 embryos purchased from Ardrossan Angus. V82 was the most proficient donor of this family with 63 progeny. A couple of daughters carried on as donors, C711 has 28 progeny and was sold to Bannaby Angus in 2011. Her flush sister C715 had 48 progeny. The Saturn family is a moderate frame line with very good maternal and carcase qualities.

Saturn V82

WILCOOLA FAMILY

Kenny's Creek purchased T138 from Ardrossan, a big framed matron by 036 x Q82. T138 was born in 1998 and her IMF EBV still stacks up well at +3.2 with 28 progeny recorded. The Wilcoola family are typified by large framed cows with good udders and rib angle.

Kenny's Creek Finks Miss D118

Females from past sales at Kenny's Creek Angus

KENNY'S CREEK FINKS
MISS D118, top priced
female at the 2014 sale,
purchased by Moore Park
Livestock. She was sold
pregnancy tested in calf
with a female calf to Mentor.

Kenny's Creek Bara D367
was sold as a pregnancy
tested in calf female in
2011 to Kyah Park Angus

which is owned by Gary
Wilkinson. Hellrazor H1
was the progeny and has
been contracted by Genetics
Australia.

Hellrazor H1
