In addition to growth, fat and muscle we have also been putting emphasis on eating quality when selecting sires over the past couple of years. This is being recognised through not only pedigree linkages but also genomic testing.

**Eating Quality Index has been added to this catalogue:**  
The eating quality index is targeted at terminal producers interested in improving the meat eating quality of their prime lambs. The EQ index is based on the same production targets as Carcass+ with the added emphasis on eating quality traits including Intramuscular fat (IMF and Shear force (SF5).
